All session transcripts

Week 2 Day 4 - 1 October 2026

Automatic draft - check the recordings for exact quotations

All recordings were processed locally. Speech recognition may mishear names, accents, room discussion or overlapping voices. This is not a fully human-verified verbatim record. Speaker identities are not assigned. The study guide interprets the content separately.

Total recording time: 03:40:24

Timestamps restart at zero for each recording. Use the session number as well as the time. Short speech segments are grouped into roughly 45-second paragraphs without rewriting recognized words. Individual TXT and SRT files provide finer timestamps.

Jump to a session

Session 1: Product optimization and conversion - 02:09:51

GMT20261001-054757_Recording_1920x1080.mp4

Session 2: Sales demos and workshop - 01:30:32

GMT20261001-090151_Recording_1920x1080.mp4

Sections needing extra caution

Automatic recognition may mishear names, accents, classroom questions and overlapping voices. Session 1 opens with a group check-in and energizer, includes informal health/supplement remarks around 00:18, 00:30-00:38 and after 01:58, and has repetitive/unclear background speech after about 02:07. Session 2 after about 01:02 is workshop/background audio with repetitive or unreliable recognition, not dependable lesson evidence. Health remarks are not medical guidance or reliable clinical evidence. Check the original recordings before quoting. Speaker identities are not assigned.

Session 1: Product optimization and conversion

Source: GMT20261001-054757_Recording_1920x1080.mp4

Recording duration: 02:09:51. Times below are local to this recording.

00:00:00 - 00:10:00

[00:00:02 - 00:00:48]
How are the Vicarious for Lessing? How are you doing? How are you doing? We've seen some. Alright, so we have not many companies. Not 20 companies. This is the quietest morning ever. Can we have you much? The strongest. Do we have any information for our company? We should all go into another room and not tell them. Alright, so how are you guys doing? Good, very good. Okay, how was the session? What is the new learning? What was the aha moment?

[00:00:48 - 00:01:36]
I think I would say aha moment but it helped us to structurize all we had in our heads after the first week, after the half week. second week and it helped us to prioritize those experiments and it rocks I don't know, it rocks so I had to understand what to do first, what to do next and how to handle all these ideas process, prioritization and some goals what is the most exciting idea on this right now?

[00:01:39 - 00:02:28]
so many ideas I can't wait to find out or to test it out I don't know So that's not that exciting one? Too many exciting stuff. If it's that exciting you should never forget it. For us we just decided that let's step into the US market. Let's make the bar much higher. Yes, that's the exciting one. I think for us, I think I don't, I'm a perfectionist, but not like I don't take any action, but still we could take more action.

[00:02:29 - 00:03:13]
And that was very beautiful, our composition is that we did a week. And he pushed us in a really good way and we kind of saw pros and cons of pushing this out so that our email is not here or waiting. I already written emails on testing email to my other account. Going all in soon. So I think that's very exciting for us. So what else is that the idea of? Just pushing out to people and getting new feedback that we haven't done before. I think that's like testing the campaign, testing email marketing, really aging the people. And I think that's the biggest thing that we are preparing is myself and we are excited to find a bunch of it. improvements as well.

[00:03:15 - 00:04:00]
So, yeah, I think it's a plan to write it actually. Plus, also, we have a lot of good ideas around learning by sitting on the meeting. So that's also very exciting for it. Just more important, like, see how we can bring value to other people and other business models. All right, cool. Thank you. You're going to go with the most exciting idea on your experiments, by the way. We have created an essay to experiment with imagining that we are going to go to Expo and so on. Then we don't have time. And what worked for us before, we got many leads from the Expo, not from being there,

[00:04:00 - 00:04:40]
but from personalizing messages when we are looking at somebody to post about so we are not going to go anywhere we will just post that we can go and make it so so our experiment is to do the same but not spend time and even posting artificial intelligence water that we are here all right okay and really honest about this but Yulia came here she came here I'm so proud of myself, also excited because she had a really good sales goal, but she took a little more free job and she like fucking crushed it.

[00:04:46 - 00:05:33]
That was the cutest she'd ever been like outside, so that was good. I love it. yeah and i was coached before when he was in advance i scheduled the call and he was like He told me the management. Yeah, of course. It works. It works. And even scheduling the call and asking what is your decision, Johnson, what you're going to talk to your boss. And he was like, yeah, so you own it. Yes, he owns it. And schedule the call to sign the offer.

[00:05:35 - 00:06:22]
Nice. OK. We're talking about what's the most exciting idea on your I'm not getting wrong. Actually, there are good

ideas. Good. What is an exciting one? Actually, the exciting one is to understand when the customer sees value. So this moment he starts to unlock conversation with people and then you try to observe him. And then you say, okay now you have three new connections that you don't know. What if I don't guarantee you 20 months, plus 100 years of this.

[00:06:22 - 00:07:09]
So you see the height of the excitement and observe this moment. Okay. What is still challenging? not necessarily about this session but everything from the beginning of the program or in general the business what is still challenging and you have not figured out yet and you need help from us or from other mentors or or using time like what is the most challenging still We have a couple of deliverables on the list. We have the . For example, the generation . That's exciting how much I had to talk. We asked, but it's not clear.

[00:07:10 - 00:07:55]
No, just because you guys went back to your ideas, and then you are not clear on the organization. No, no, no, I mean just for today and for tomorrow, but we still need to be passive. some of them not clear which one are not clear the introduction plan plus first ok so strategy like a chart strategy oh, I don't know, the introduction yeah okay, plus first plus first plus first

[00:07:57 - 00:08:41]
I don't know, you wouldn't hear Who put it in the pool? Who put it in the pool? It's just scratching. I'm not running this. I'm fine. I'll find out. Just remove the list. Maybe you have something else. Is it scratching? No, no, it's ours. I'm scratching. No, it's the when you put Ah, yeah, this one. So remove the lease and then just keep the generation. Robbie was like a fighter. He's like like the U.S. Church. Okay, anything else?

[00:08:44 - 00:09:29]
So for us, the process is something that we have as a process. We used to give every customer a safe, but we learned that it's ICVs and Wi-Fi. So some customers they don't need sales time because they are not breaking their sales first so they don't need quality ratios. Ok. So just for everyone, you guys start thinking how you communicate that customer is the one who already gave you money, right? It's the visitor, lease, prospect, but it's not the customer. customer is going to be someone who pays for special. So you're talking about leads and visitors. Yes.

[00:09:29 - 00:09:59]
Yes. Alright, anyone else? What was the most challenging? I think for us it's a little bit like frustrating the fact that what we build is not yet at a stage where we know that but it's so shareable, not yet the value that we know we can bring because it needs a bit more time so I think that's for us a bit of a frustrating and challenging thing that we are working on and

00:10:00 - 00:20:00

[00:10:00 - 00:10:41]
every time line. I will virtually get my notes on more stuff. So maybe that's enough. So what I'm hearing is that MVP works so very important to the deal. Yes, yes, yes. Yes, yes. Okay. I hear the perfect things in the room. I'm one of them, but let's just launch the NMP and polish it later. We are not there for that. I just wish it would be more reasonable. I know you get more attention and I know you won't have the best attention how it looks like, how it feels like, but it's quite powerful. Any challenges?

[00:10:50 - 00:11:36]
No, I cannot complain. Well, yeah, just grateful for the tools that we got and expect for the sales demo just to have the final piece of what to do and after the end, that was good. Alright, cool, thank you. Well, thank you guys for showing up and being part of the program still in person. So two more days to go, keep booking office hours. There's still spots . Today we'll have people asking about product optimization and . And then the amount of review afternoons.

[00:11:39 - 00:12:25]
and tomorrow we do have one more workshop and then we will in the afternoon we will try to meet you and your president managers we will go back to all the the rules that you have on your lease and see word about how else we can help you to get it out of your way as well as we agree on the next strategy for the next eight weeks between traffic and prevention sales all develop and then also you can expect an email from your with natural scheduling calls for the weeks to call and then Maya will also explain tomorrow how the

[00:12:25 - 00:13:13]
next eight weeks will look like so we'll have more clarity on that any questions all right cool thank you guys so now Nicholas will yeah but yeah it's ready it's ready but let me share the agenda of the day so Nicolas will be stepping with the session on product conversion and optimization then we will have lunch normal lunch without any lunch and learn so feel free to use this one hour as it's needed for you and after this we will have session on the sales demo from Brianna and then office hours as

[00:13:13 - 00:14:00]
always but before we jump to the sessions please scan this QR code you have not put in the feedback from yesterday, take one minute to it right now it's the same one yesterday, it's from yesterday so I think you already know you are done so no need to check in by the way, this is something interesting I came from a good start background and I always amused that someone in the world and 100 grand for like X1% of me even free that year. It's like why would people want to do that? It's just more of a low risk thing that people can do. So I felt it's a pretty much awesome, but it's like, it's a big option.

[00:14:01 - 00:14:46]
And I think 500 is a brand where we also take feedback seriously. So whatever feedback that you give to us is not living only at that table. the program team everybody looking at it and say okay we're going to do better things like that so we practice what we preach right do we hold we the team holds the mentor and team accountable on delivering the best program and also the best program so yeah appreciate the feedback beyond this help us and others this one for the day. Victor do you want to after one minute do you want to like follow people up? Yes. Okay. I'm ready.

[00:14:52 - 00:14:55]
I'm going to be the warm up expert here.

[00:15:04 - 00:15:11]
That's too late. Yes. Once in the lifetime experience.

[00:15:43 - 00:15:43]
Thank you.

[00:16:14 - 00:16:17]
Thank you.

[00:16:38 - 00:17:23]
Yeah? Okay, good. So, let's move guys. Last, last, let's move, let's relax. Everybody listen, everybody listen up. We add some breathing, okay? Just quickly. Wait, I need to record it. Very quickly. To change your state, we need a little bit of breathing, okay? How do you breathe? Come on what is this? Guys, what the fuck? Let's go, let's go! Change, change, change, change! Let's go, let's go!

[00:17:26 - 00:18:09]
Okay good, now we go! Breathe in! One more. Okay, a bit. Let's do this on my daily. Down and up, down and up. And other side. One, two, three. Okay, I think that's good. Dimitri got a little more, Dimitri got a little more. Atila, what are you doing? It's tough. Are you jumping?

[00:18:12 - 00:18:15]
Okay, good. Thank you guys.

[00:18:46 - 00:19:33]
okay Victor, why do you get people to breathe? I do breathing every morning for like the past 64 months there's a lot of signs showing especially belly breathing because there's a difference in your brain and anxiety and a lot of subconscious stuff turning on this engine that we, because we are breathing through our chest and basically that's reducing a lot of cognitive abilities and everything and by turning breathing on in the morning, like after it, it's that connection and I feel like really good, I feel like I almost had a cough in the morning but I didn't have a cough, so it just works for me and also Tony Hopkins does a lot of breathing and like changing your state

[00:19:33 - 00:19:59]
I'm just raising the oxygen level. Yeah, we'll sidetrack a little bit. Who's going to pitch in day three? You guys have any idea, Rafi? Probably going to pitch. This week, you're going to pitch. I'm going to pitch. I'm going to pitch. Who will you think is going to pitch in day three? What? Day

00:20:00 - 00:30:00

[00:20:07 - 00:20:55]
Is that all the motivation? Members will choose or you choose. You guys will. You will. You guys choose from the team. Oh, no, no, no. I'll sign back. I don't think so. No, wait, see. I don't think you're not a good teacher anyway. It's a story you're telling me. I've seen him on interview. Who? I'll tell you, we'll sidetrack a little bit. I'll tell you, we've done, at least me personally, I've done, this is my three batches. We haven't just done batch from batch one, so they have like 11 batches and more. One thing I'm going to tell you, when it comes to base three, we have two weeks to track how to pitch.

[00:20:55 - 00:21:43]
Even the person that felt that they were not a good teacher, when they go up on the stage, they kill them. It's the same story that I talked about with a similar quote. The perceived seating is here, but with the right process and the right profession, the perceived seating is here. So I think it's something that is worth thinking when it comes to team setting. As mentioned yesterday, to get to a different seating you need a different mindset. And the best and best way to get a different seating is to get people with a different mindset to come and talk. It's almost like what you were mentioning, suddenly you were reading the sales process, they followed. But it's not the case, so a lot of people is like, they told me they don't have time.

[00:21:43 - 00:22:30]
They told me that, sure, it happens, but not absolutely. It's a probability. So there's a certain thing that wasn't really talked about honestly that I observed when it comes to running a business or running a team or getting results. is people miss out the interpersonal part of the business. So everything that we talk here is very technical. The marketing, the expectations, and things like that. But really what you see is different. When you go to a sales call and sit with that person, the way you're talking, the way you read the company, it's actually, you're not manipulating, but you're actually giving them to do something that you want. but that will be a lot of like there will be another whole new composition and discussion

[00:22:31 - 00:23:20]
and one of the things the reason i ask about reading is because we will have the same in the afternoon so you guys can like for example uh we have a sitting here and then we're gonna do the demo and then you ask questions things like that one thing that we did not talk about in that session you definitely don't have questions and things like that but one thing that's not very well talked about because it's unreal because it doesn't seem conventional is trying yourself physically to be in that column and the way you speak and the way you pause the way you um slow down is quickly important in persuasion right so for example the guy yesterday they found a car at the company the way you speak super slow, explains to you his perspective, not arguing each, not trying to win

[00:23:20 - 00:24:06]
you over, but explain to you. Those are the minor stuff that makes up a lot of like impact when it comes to closing sales and also being in the team. So it's someone that which means that you guys have the time to take care of your well-being, that will directly impact your performance and you will see because these things are not talked about but it will definitely affect your performance, the way you speak and things like that. Cool? Alright, thank you for the feedback that you guys put in and I'm looking at, but hopefully this gives you a different perspective. This is my last session today and I want to piece everything together about everything that you have to talk in the last one week and a half from different mentors. Just understand that the matrix, the experiments,

[00:24:06 - 00:24:56]
and everything is your core, it's basically your own AI, it's your memory layer, it's your knowledge layer, it's your decision making. One thing is, you think about abundance of information in AI, there's a lot of information, but what is that mean is proper decision making. How do you make the right decision at that time that works towards the results that you're getting. This is the muscle that we use. good okay today i'm going to talk about product um here's the thing i will prep you mentally i'm not going to talk to you about how you want to build your product because your product is very different you have an air product you have a health product and then we have like a job work and things like that i'm not going to talk to you about the product itself product let growth will be one of the sessions next week that you can pick the brain of jackomo like how do you use

[00:24:56 - 00:25:40]
product to go for me this session is all about seeing product from funnel perspective so when people think about product people will be like ah i want to put this feature i want to add this thing i want to do this this part of experiment that's great and we have the one issue that matters but if you try to see your product from the lens of marketing which is very unconventional okay i repeat you see product from the lens of marketing you will see completely different things on how to We'll talk about CK-study as well. I'll give you guys a tool, a very simple tool that I think Julia has already implemented. And you guys can see your product that way. So you can bring the concept and apply it into your workflow.

[00:25:43 - 00:26:30]
Okay. Part 1. How product perception affects conversion. painkiller vs vitamins. Anybody understand this? or you already understand this? ok, I want to see your pain. What is painkiller? I'm pretty sure it's a similar concept but let's see what we do about it. Julia, let's go. What's a painkiller? It's something that you cannot respond. You cannot respond. So what I mean is it's urgent. Wait, anyone else? Just to fix the symptoms and not the cause? Could be. Let's say you have a product and you categorize them as anculin versus vitamin. It's a very simple way to categorize products.

[00:26:30 - 00:27:15]
We'll go much more advanced. But this concept a lot of people know about it. But we'll go much more advanced. I'll give you guys a little perspective. So Julia says that. it's something that you need immediately okay Eric you said that you probably saw the same thing not the good cause maybe maybe not I don't know okay but Belly, anyone else? something that you can sell instantly without big investment okay for advertising like vitamins and agents you need to under that okay Belly one has portable packaging and second doesn't one has portable packaging and second doesn't That's hardball pack. Hardball pack. Yes, like the product itself. I've never thought of that.

[00:27:16 - 00:28:02]
Let's go. I think I want you to sit. Jump and then after that, you're like... After that, I want you to sit in front. I want you to test it. I think that's a lot of this. How obvious is the effect? Yeah, I guess like Painkiller basically helps you or it doesn't, but you see the first or not you. Maybe it's something that maybe it will help me in the old run. Maybe I'll stay lost in the old run. Okay, it's time to accept that answer. The Painkiller you can play with you no longer thought. The white people you can think about. Okay, so Painkiller you'll pay immediately because it's painful and then by something

[00:28:03 - 00:28:53]
you think about it, you delete it. Pain killer is easier to sell compared to... Sorry? Pain killer is easier to sell compared to... Yeah, easier to sell. Okay? We'll go through the concept and I'll give you a different idea. Okay? I'll pair this with Rihanna Sachet. I don't think people link this information together. They think it's separate, I'll link it for you. Pain killer solves an urgent problem. Okay? immediate acute urgent people willing to pay money because they want it's all so for example in your herd whatever everybody pays a doctor nobody functions but this is exciting they still pay the impact is that it's essential and it stops the problem directly might not be

[00:28:53 - 00:29:41]
the root cause but it solves the problem immediately okay customer response is that it's highly known because that's clear benefits but one key with here is that it relieves the pain immediately. The speed is part of it. Okay? Example, medicine surgery. All right? Vitamin. Vitamin is something that offers additional value, convenience improvements but not immediately, not necessarily immediately. Okay? It's nice to have the value goes up all the time and it's something where if you don't have it right now it's totally fine. Now example is probably meditation now, mental health or I would say probably even reading. People see reading technique as a vitamin, not a pain killer, so nobody does it.

[00:29:42 - 00:29:55]
People would rather take what medicine, drugs, something, whatever. Is supplement a pain killer or vitamin? Okay, what is it? He's a doctor.

00:30:00 - 00:40:00

[00:30:00 - 00:30:45]
I'm a osteologist. He is what? I'm a osteologist. I was like, you need to eat these nuts. Great. Good. Talking about this bullshit, right? OK, we'll come back. Anyway, you're the second doctor that tells me that. I'll tell you one really funny story. I went to a cardiologist. I did a very good body check out and I did a secure endograft to check the heart and everything. And the doctors told me the same thing. I want to be doing supplements. They talk about endorsements. They talk about egos results. Don't move in. So we had a chat. Chat, chat, chat. And I was like, how do I optimize this marker or whatever?

[00:30:46 - 00:31:32]
And the end of the conversation was like, ah, if you want it, I can make a supplement to you. I thought you didn't really believe in it, so why should you recommend me watch? I was like, yeah, this is a funny experience. The printing stuff is really interesting, this not Indian stuff, and really like, oh, we need this. Actually, yeah. But in the mind of the end users, they cannot comprehend because sometimes human beings are weird. they will think seriously, you put it on the fire site, they will think seriously. Yes, and it's also an educational stuff, because someone who doesn't know what to go, they perceive this as something like long term. Yeah, okay. This pen right here,

[00:31:34 - 00:31:46]
is it a painkiller or is it? Okay, talking about situation. Okay. Right now. Okay.

[00:31:58 - 00:32:43]
It's a fighting game. Somebody is on the street and somebody tries to kill me and I need to kill them back. How do I ask them to kill me? One second. It's not wrong. For example, if you are in a swimming pool or you are on a disco and somebody gives you a pen, I cannot help. You don't want it because there's no use. Okay. Okay. If someone, okay. If I give you, if I sell you this right now for a hundred bucks, for no reason, would you take it?

[00:32:45 - 00:33:30]
If I tell you, for example, by the way guys, I think you guys know the concept, but let's be fresh. Because knowing the concept and really thinking about it in your context, people need to get So we need to install that program in your product to look at your product from that place. Okay? Here we go to my patient. Yeah. If you're signing a contract right now, it's five minutes in just one million dollars. Yeah. No pants in the room. And then I came. I say, I'm going to sell it to you for $10,000. Would you take it? $10,000 for one million. Only after the money arrives. Oh, let's assume the money arrives.

[00:33:30 - 00:34:22]
David, would you take it? I was thinking about it. You're still thinking about it? But the contract was one million. One million, yeah. You take it without thinking, right? But there is a contribution. With a refund option. With a refund option, yes. This one, he came to contract. Sounds like a cool. Or you can just say, yeah, I'm going to buy it for 10,000, but can you co-rate it in the next one? Maybe I just read it. You just read it, yeah. But Dave is still thinking about it. I was thinking, like, how do they get into a situation where I have this concept and I don't have a plan? Dave is already in my situation. But Dave is doing root cause analysis. That's correct. Okay, I'm like, we're just saying, but... So it's the same concept for example as water. For us here water is like water, not special, but if we were in desert,

[00:34:23 - 00:35:12]
it would be so valuable that we would give our lives for it. Yeah, so we talked about the concept already, pincular versus vatillin, we talked about situations. Ask yourself this, you're selling a product right now, okay? You have come to one week and a half of training, you have learned like ICPs, whatever, How do you apply what you just learned in your situation in refining your growth market? How do you apply the ICPs that need our solution or any more solution urgently? Because somebody doesn't want it, somebody wants it right now. And especially important for products that aren't. sorry what you just said is correct and especially for the products that are

[00:35:18 - 00:36:03]
especially for the products where you can do a lot of things so my own product your product can do a lot of things your product can do a lot of things half of your room most of this room your product can do a lot of things It's a blessing and curse because if you think about how you talk to people when you started the program, what is the one common objection from everybody else? What is the one common objection, one common question from everybody else? What customers? When you met the mentors, right? Or when you met Pedro or whoever, and you explain your

product, what's the most common objections you notice or common problems or questions you then ask you? Why are your customers different?

[00:36:04 - 00:36:50]
Yup, that's one. What are you selling? Yup, that's two. What is your customer? That's three. That's correct. Because the product itself is so wide-ranging, that will solve so many problems that people don't know who they're trying to solve. Is it wrong? No. But the question is how that affects the growth market is a big question because that's not even another question. Because what you're trying to do is that you're trying to formulate a strategy. And this is what Hooky does in the last one week. I have two ICPs, I don't know which one I want to go. Right now I'm going to go with this one. But the problem is that with this one, you have a lot of different proposition because you can do a lot of stuff. it is the type that when you tell customers that say this is a pain killer to me probably

[00:36:50 - 00:37:39]
that's a little bite to me we don't know it's a question for you guys to partner okay you see how i'm trying to help you guys to see your product from different lengths it's a different lens of seeing your product and your world to market okay if you still have doubt please ask me the question i'll ask you i'll go to the next one okay painkiller of vitamin for a lot of people when it asks you for example when asked you is this product a painkiller or a bitumen i think we have a pretty black and white answer did you guys know this guy you know i was like stop him and push you but i can put it to you that's probably not um i can back to you 70 percent work sorry 72 they work they what they work in 70 percent cases yeah it tastes like these basics right so we didn't just because of the plastic effect they work in 70 percent

[00:37:41 - 00:38:28]
but you need to believe that it's also important otherwise it will be possible there's one thing that i want to insult in your brain and this is one of the ancient in in how i see life is that if you think about things as black and white work versus normal work or like uh disposable not disposable things like that it's one lens to see that thing it's not the wrong lens there's no wrong lens it's just one lens to see that thing but another way of seeing things is a spectrum thinking so it's not about like or white paint killer versus disney it's contextual and it depends on the context and this spectrum so most people don't think about spectrum

[00:38:28 - 00:39:17]
they think about a box you go either here or you either here okay but you think about things from a spectrum perspective you're not either here or either here it depends it toggles so for example this pen here okay if you think about it from a black and white perspective it'll be like ah can use it but like what you might say if it is an urgent situation the tent is not useful it's actually okay so urgency is one so the urgency really affects the position of the product okay what does that mean to your growth market think about what does that mean in your post market? From a capital allocation perspective, let's say you have a divergent go to market first

[00:39:17 - 00:39:59]
in ICP, we can assume that the post-pacters will be over. There you go. That's one. That's a big one. What's next? You talk about cap costs. But what's next? He would stay longer because we sold an energy problem that he was more committed, more loyal what's next what's another one there's one more speed there we go speed you have you have 100 brand let's say you're designing go to market we have all these things uh one way if you get matters we learn a lot of techniques marketing whatever from um you know

00:40:00 - 00:50:00

[00:40:00 - 00:40:47]
justina you learn about icp whatever you've got to call it and bring them together because that's right and you design your screens but one thing that really changes think about it as a machine and then it's a funnel you have the structure the funnel you have the process you have things you want to test you have different icp but icp is just one right but But if you layer in the urgency factor into your ICP, ICP is like, okay, I'm person A, I want this, this, this. It doesn't mean that I'm person A, I want this right now, it's two different things. I want this, but I might not want this right now. So if you layer in urgency in your strategy planning, that means that you could possibly directly orientate your go-to-market that says, I'm specifically, given that I don't

[00:40:47 - 00:41:39]
have a lot of resources right now i'm specifically looking for profiles like this where they have urgency built in by themselves and our job is to extract or serve them whenever they need to be served at that given amount of time okay

does that make sense urgency has to be built in which is a low-hanging fruit which is what we talked about yesterday it affects your built-in market strategy Is it a theory? Yes. What does implementation look like? It depends. For example, folks that have run e-commerce before, we know Black Friday, Cyber Monday is a big one. For some companies, the Black Friday side of Monday is actually that part of the season, some call it Q5 period. That period probably accountable at least 30, 40, sometimes half of the year's revenue.

[00:41:40 - 00:42:29]
Okay, so my question back to you is based on what we have learned in terms of analyzing numbers, matrix, that was last week. I talked about one word, why are we analyzing trend lines? And why do we need to collect data to enable a trend line? What's the keyword over there? Why? There it goes, keyword seasonality. So I'm leading back to my presentation last week. You want to collect your data right now every single day as possible, which is your spreadsheet. Because one year from now, what you're trying to do is that you're looking one year back and look at seasonality and say, what are the things that place it to my paper that I don't pay for it, which means your caps are low. But you can get a maximum profit from it. Every section would have seasonality.

[00:42:29 - 00:43:14]
Okay? So I'll finish this and I'll come back to you. City of Nauty also means built-in urgency which leads back to this one. That's a built-in urgency that people needed that. John Ross, when is the low season? Low season. August. August? Why August? Because most of the companies they stop hiding. Okay. Julia, your sector, do you know where is the low season? When is the low season? Do you know roughly? August. August. Because of summer as well? So the summer, yeah. Yeah. So how do you sell in the summer? That's the question. How do you sell in the summer?

[00:43:17 - 00:44:03]
By the way, I'll tell you guys in a real life case study, like seriously bro, that these people eat low season. How do you sell them in low season? Okay, good. That's right. What else? We sell more than one month before the low season. You sell earlier, right? In front of the money. What else? Now please, we are trying to catch people before low season and create a sense of urgency to prepare anything for them for the high season. Sounds good. Scheduling levels before the end of June.

[00:44:04 - 00:44:53]
Sounds good. All of you are correct. And there is another thing as well, that is contextual. there are some companies where low season is increased that actually yes it affects you but it doesn't mean you can't overcome low season weight things that you put on your side please remind me on this one because as i go to one piece i'll tell you how it did low season okay remind me if i if i don't talk about it okay so think about this think about things in a spectrum That will change the way you see your product and the broker market. Another thing is basically this. If you layer in ICP against, for example, urgency, you will get different results.

[00:44:53 - 00:45:40]
It's a matrix. For some ICP, it's the same product. For some ICP, they need to be a product a lot more and a lot faster. And for some ICP, they probably don't. Yeah, I'm pretty sure for example, will see a lot more stuff. And I think you guys are like, I think you guys are hoping to some of your ICP that you feel that, okay, that is like what I want right now. People that ask. No, it's not like that. It's probably a huge problem. We haven't found out of the end of the month. Yeah. Yeah. So that's why we are here. Is the SuperbAge or CUs as a pain killer?

[00:45:40 - 00:46:26]
No, we have talked to the champion a few days ago. And actually said that they have to experiment, to test, to provide today customers more ways to interact with the app. and more ways to get to know the information. That's why I decided to go on. But it was never... In the Instagram page, it was so painful for them to actually... Yeah. Makes sense, Belly. But also, you got them. You can make your product influence them by making sure your product is... You can integrate it with them. Yeah. So, again, there's no like... I think it's just the way you're going to...

[00:46:27 - 00:47:12]
I think that our current situation is about that they have a lot of profit they cannot serve with their sales team and it is a pain for them but they are not sure if our solution can extract some revenue yeah so I mean the problem maybe it's not about this so the payments exist but our solution is improved yet so it means that they are not sure if you are like words or not and just try and see what's going on Justina taught you guys about marketing awareness not solicitation, awareness what's the 5 level awareness?

[00:47:17 - 00:48:04]
That's what's the five levels of awareness? Five levels of awareness. One of them is like how to work. A mechanism. Emotional. That's sophistication. That's not awareness. It's a matrix. What you talk about is your product issue. There's nothing to do with the pain. They have the pain. We just need to make sure our product is diverse and we solve the pain. That's all. Does that make sense? The product itself doesn't invalidate that they don't have the pain.

[00:48:04 - 00:48:50]
They have the pain. They just have to do our job. That's all. Simple as that. Two different things. Okay? Okay. He he, Gucci bag. Avina. Is this pain for them? Or some? A little bit. I don't know. Let the old Lesher leave. This is a product. It's a pain healer. It's just... I'm trying to do a discussion about... Turtles. I think I'm going to talk about it. Why do you have to do something? Why are you? Why are you? Why do you ask? It's really a problem tomorrow. Please don't do it. No, no, I did it.

[00:48:52 - 00:49:39]
I did it. I did it. Okay. Painfielder, wait to me. This is absolutely true. Love. There was a certain category of candy. It's all like that. I have seen in the first line the third category of camping. For me it is more like camping. It is more like camping. Depends on situation. Ok, let's go here. Depends on situation. If you are going somewhere where everyone has the same... and here you can use this, I think it will be not good sometimes it's a bank if you need to do something, you can do something

[00:49:39 - 00:49:59]
if you need to do something, you do not have a bank and this is the only solution within the world like taking something that doesn't matter if it's good or not this is a bank, that's a bank but in the United States it's only a bank killer for the buyer the other one, a 10-0-0, a 1,0,9,0,0,0,0

00:50:00 - 01:00:00

[00:50:00 - 00:50:45]
And not them, they need it's a particular. The rest is the one. Another thing to take into account is, this again, go back to ICP part. There are different ICPs. If you ask me is Gucci bag a painkiller? I'm like, I don't need the Gucci bag. Let's say if I'm a woman, and I want a product bag. For me, I don't value this thing, so the value for me is zero. But if you go to probably high society, or like you go to causing a big deal where you have a look at, assuming that's the situation, probably it should be a case. Or a husband who is tortured by his wife and he passed the fire. It's a pain killer. Yeah, it is a pain killer. That was exactly the one.

[00:50:45 - 00:51:31]
Are you in that life? There are some rules here. Yeah, we got one part of Julia we didn't know. making a gold ear that is a bag of gold. You say it, okay. This one. Okay. Coca-Cola in for example, right now you go outside and buy Coca-Cola, let's say it's one buck. But you go to the hotel or you go to like high-hand airlines, business class. Coca-Cola is pricing an objective, right? So what does that tell you about the product? The price is seen, but what does that tell you? They know that the price of the water change depends on the place where the product is.

[00:51:31 - 00:52:16]
Yep, environment. So for example, gas stations also. For example, if you go on the road, highway, and there is just one gas station and nowhere in any other store, the price of the product can be 10x because you have no choice. It's also supply and demand, right? Yeah, it's also supply and demand. Yeah, but I say supply and demand is not a problem, because in our case, in our country, supply is not a problem, we have endless supply. Good, you guys are correct. But I just want to be referring to it, just to make sure you have the same product. If you are in the cinema, and there is one Z-Bot, that's like the end. Hey, come here, you are correct. There is only one supplier. for pricing equation. Yeah, makes sense.

[00:52:16 - 00:53:02]
Then we have PhD manpower telling us that. So finally we won. It's an economic equation. Okay, economic equation. What's the point of all these concepts? What's the point? What's the point? That it's about position. It's about position, yes. But, timing, positioning, timing. what else focus sure also correct if you look at this table over here this is a simple matrix you guys can think about okay you can put the product here your product is if you look at

[00:53:02 - 00:53:52]
product as it is it's just a product but if you look at product from this lens it helps you with your focus, it helps you to identify the right environment, it helps you to capture the right time. So if you go to market, you've got to figure out. I think so far when we look at experiments, the go to market, ICP and everything, one thing that I don't think we talked about, that we should kind of talk about, is think about the urgency of it, so it's vitamin P killer, urgency building, Another thing is that impact of it. One thing about impact is basically this. I would impact what? Just one thing. I think in our business sometimes the pain is not yet accessed. It will come. So maybe we can use this as an analogy like not selling vitamins but selling steroids.

[00:53:52 - 00:54:37]
It's sort of, you know, I mean, we could add it. It's going to be a high return. Okay. In a good way. Yeah. Just as an analogy. Yeah. Hey, I don't care about analogy, although we talk about analogy right now, but stereotype depends. It's a regular for some people, you know? Yes. Yes. The speed. And also a killer. Sorry? For some models, a killer. A killer. I was glad to think about your product in this country. You have different ICPs, you need to map it out. For example, when we go to market, we go to conferences. My next question is that when we meet with a sales team, we ask them, okay, we speak, we speak, whatever.

[00:54:38 - 00:55:24]
Did we categorize those and we buy it? This is an industry, this is a company size, and what is it that is attracting them that is urgent right now? Or that is not really a good thing now? These are the things where I don't think a lot of people talk about, but it is really important. Because you don't control sales cycle. You control sales cycle to one point. To one point you control the sales cycle. How do you control the sales cycle is what Julian was doing. I structure out the process, you follow. So I control parts of the sales cycle. But another thing that you don't control is the market forces, the ICP itself, where they are in the pain and the timing. control them but what you can control is how do you find these people and that goes back to resource

[00:55:24 - 00:56:13]
allocation because if you have 10k in the beginning try to spray the 10k actually try to find something out but if you're smart and you're sharp you will start thinking about things from this perspective the timing the environment okay and how do you have the focus so right now we have a lot of leads right but one thing that we need to do is that maybe we should build a forward plan and the next one to get this type of piece okay in hope with in hypothesis where somebody comes in i have a shoulder cell cycle with speed at the coast okay and i can basically make more money with the shoulder time while i read for like a bigger contract with speed contract even the shoulder cell cycle so it goes to the mix of your planage okay the best part in relatively speaking are icps that are there okay

[00:56:13 - 00:56:59]
they have an acute pain but one thing I didn't talk about your product has different impact to different people your price might be the same but your impact to different people might be a little bit different okay for example let's say your tool can be used by a lot of people no doubt let's segment it out people that wants better sleep people that want better skin people that that one better part or whatever, set your limits. Which one will have, which one that uses your tool will have high impact or which one will have an immediate impact? It's different, okay? But you're probably not gonna say, or you might change your recording. Same with dog robs, right? You have different segments of customers.

[00:56:59 - 00:57:46]
Which one has the highest impact? You gotta think about it. You gotta think about it there. Okay. Any questions so far? part two, how do you do optimization in your car? Julia? I'm not clear that it's about all these for us, but do you encourage us to think of the pricing, different pricing for different things depending on their . Yes, I would start testing pricing as well based on ICT. With a hypothesis that these people have much more acute pain relative to another one, and hence, I'm able to charge more with the same time that I am, For example, there's this thing in the agency world, like marketing agency. There's not marketing agencies in the world.

[00:57:46 - 00:58:32]
There's a lot of marketing agencies where they work with early stage startups. There's some marketing agencies that work with no stage. There's some marketing agencies that work with hyperworld. Okay? Whether or not they're conscious about how they decline, that I don't know. But every single stage, there's one question in the real-time marketing agency that you need to ask yourself, other problems I don't want to start even what they pay me right now. So for example, I would never solve, I want to work with early stage startups as a marketing agency for example, it is because the same amount of money they pay, you need to try to solve a lot more problems for them because they

might not have private market, they might not have channels, etc. So with the same amount of skill sets,

[00:58:32 - 00:59:18]
I want to work with the different ICT, probably growth stage, where they have already a humanism because they might be like I don't know how to organize the resources, I don't know how to unlock more revenue, I have structural issues, whatever. So your skill set probably is the same but your impact and delivery and your workflow based on ICP is completely different. And as you know the problems are there, they always have a set of problems. The next thing is what part of the problem you're going to suffer in. That will talk about it later. Okay? Is it going to the brain, are you guys thinking? have different lengths to lay it with your product and plan to reflect how to open our brain. Any doubts so far? We're going to talk to the how to's.

[00:59:19 - 00:59:59]
No? How to optimize your product. Have you guys heard of this framework? This is called a pyronatrix. Pyronatrix means A-A-R-R. They say aaaarrrrr pirate. Okay. Lay. Whatever. This matrix was created by one of the earliest Now, one thing I just want to tell you, for me, a framework is a lens to see a business in a different lens. A framework is just a framework. I use this framework because it's simple to understand. So if you look at your image of the spreadsheet on the left-hand side, it is designed for your RD. You don't need to take pictures.

01:00:00 - 01:10:00

[01:00:00 - 01:00:50]
The matrix spreadsheet, you have it on the left hand side. Acquisition, activation, retention, revenue, referral. To vote. And then that categories will have sub matrix over there. All categorized properly. Okay? Acquisition means how the customer will find you. Activation, how do you get them to get quick wins. What's the top top of the win? Okay, I'll talk more about it. Retention is that why you need to stick with you. Referral is basically you want to refer you to some people and then revenue is basically how you get normally done. Ok? David? Why cannot be a referral for the position? You can? Not a problem. Referral is part of a bad position. By the way, free books are not mutually, business is not mutually exclusive. Business is limited.

[01:00:50 - 01:01:40]
I just have a feeling that it's less important than for other ones in terms of focus. By the way, this part I'll talk more about doesn't mean you need to focus all at once. This is just a framework where you receive product from this magazine. And the framework is also for you to see your marketing for this magazine. Victor? The referral box is I assume there because it's a different strategy. Right. Because like acquisition of the first customer versus getting one month from the door. It's a different approach basically. So that's why it's like segmented. By the way, sometimes when I work with companies, I don't even use referrals at all. Sometimes, by the way, that's also one case I only work with activation and the company.

[01:01:40 - 01:02:26]
So this is just a framework. Maybe this is a framework if you want to have your own. Okay, give it. The main thing from this metrics is revenue, other referral etc. It's just for increasing revenue. Because if we need more users or more activations, it doesn't mean that you earn more. Also, if you sell into not our ideal ICP, we can get a smaller revenue. we can sell for our cases to hundreds of followers and they pay just 20 dollars but we can sell to 50 big companies.

[01:02:27 - 01:03:11]
We will increase more and more. Yeah, for sure. You are absolutely correct. Okay, this is just a break. In your matrix tracking spreadsheet you will see that. Okay. By the way, when you select the matrix and you highlight the matrix, and you look at the spreadsheet, what does that tell you about your focus? What does that tell you about your focus? Intervention rate? No problem. When you highlight the matrix in the matrix tracking spreadsheet, the one in the ARR, what does that tell you about the focus? I don't know, maybe like discipline.

[01:03:13 - 01:04:06]
Being disciplined about the right church, it's good to see them, speak to them, and about other things as well. It also tells you what is the most important leader you can hope at that little time. Is it harder, is it happier. Now, let's have a case study. I want to introduce myself. I mentioned that last year I took on a client, a mentorship. They are a payment company in Egypt. I met them in 500 global skill up programs. They already have a lot of users. They are trying to grow a lot more. That was last year. The company is called Flash. You guys can search them up. Flash app. They are a payment company. They have an app, they have an app, they go to a merchant, it could be logistics, it could be

groceries, it could be supermarket.

[01:04:07 - 01:04:52]
They basically want people to use their app to transact. After every transaction they make X amount of percents. That's the business model. When we started, they came with humongous amount of structures. I was in the media at the time, the person's name is called Muhammad. He's the head of leading customer fulfillment team. So it's a team of people that serves the customer when the sales team has already closed the day. Sales team calls the merchants, they have to make sure that they serve the customer. The founder was there as well, the founder was named Sarit, so they were there together.

[01:04:53 - 01:05:39]
Mohammed came to me and he asked me this, Nick, how do I solve this problem? He asked me an operational question. How do I solve this problem where I need to constantly hold, constantly push my team, my fulfillment team, to talk to the customers and try to get them to transact. I said, good, that's the problem, let's put in the structure to start the problem. In one hour, the first thing we do is that I ask them what's the salary of your team? They say, this is this. I say, cool, this is what we do as a quick break. We would design an incentive plan for this year.

[01:05:40 - 01:06:29]
So in one hour, we draw the table, we say if the team member calls a deal, or helps the team member, helps the merchant to transact, let's say 100 to 200 transactions in this record, that's your baseline, you don't get paid. Then there's a second record that says if they transact a lot more, we're going to pay this money, then we can transact a lot more, pay this money, etc. It's an incentive plan where it escalates as people's performance goes up. We resigned and probably did just one. He went and he just moved. The outcome was within two weeks the team member has around three to four at a time. Within two weeks the team member, they were only hitting target probably 70% of the time.

[01:06:30 - 01:07:20]
Within two weeks they hit 90%. So like, amazing, but it's only two weeks later, it might be a few, right? Because in life you always have early wins, early wins might only exist in the world. So we say, okay, let's age it out, let's see whether it sticks. Three months later, we say, we have already gone transaction by 60%. Okay, that's almost half. We're like, let's age it out again, maybe it's a few. six months later they'll be like oh it's stuck, it's stuck with them. One year later they grew four times. So that part of the incentive work we designed for one hour we paid for it for something for you. So that's basically the four points that we talked about. So when you design an experiment the momentum is quickly important.

[01:07:20 - 01:08:13]
So it also means that in your product the momentum, the ongoing is quickly important to set your team up with success. which is why we have 30 years in our DNA success plan. Because that quick win is going to pave way for you and your team member to have the confidence to do a lot more things. So you can imagine a person's psychology is not difficult. Okay? So we say that's the only one. So along the way, we continue to grow. So the next problem that he has is, okay, we have grown to this stage, what else can we do to grow a lot more? So one of the things we do is that they have a lot of spreadsheets. They have a spreadsheet that tracks the team's performance. They have another spreadsheet that tracks all the merchants' information, when they transact, what's the industry, the company size, whatever. I say, look, this is too much. I only want one spreadsheet that tracks everything. So one spreadsheet that rules them all.

[01:08:13 - 01:09:05]
So we spend a few weeks streamlining all the spreadsheets. So we work with one spreadsheet. call it the one moment of truth which is your age expect you only have one and you cannot manage that one i don't know how you're going to do this okay i'm giving you a different perspective in different context but it's the same concept and they implement it okay and then we look at the business and we use the AAR framework okay their process flow is basically like this salesperson goes to the company be the grocery supermarket which is company say i want you to use my app this is the price for every transaction please sign with me so that's acquisition so once they sign it's activation so i asked him what do you do with activation he say once once the one system signs it has

[01:09:05 - 01:09:51]
come to me and my team member will call up people and give them the transit that's all So look at the transaction model of your life. Let's not go to revenue, let's not go to retention, let's not go to revenue. Your biggest alternate right

now is activation. Simple right? You sign them, but you're not getting them to transact. So, which means anything downstream is not really useful. Which is one of the challenges you guys are facing right now. The onboarding is a big one. People underestimate onboarding, but onboarding to me is key to reducing strength and making the money. Because your early stage in the relationship, once you set the relationship, everything else will fall in place. So when you find yourself not to have the results that your client wants, or the results that you want,

[01:09:51 - 01:09:59]
the first thing you look at is basically that part. In their context, activation is a big problem. So this is what we did. So I introduced

01:10:00 - 01:20:00

[01:10:00 - 01:10:44]
this in this framework. You can have your own framework. And we say activation is an issue. So we set down, this is what we decided. We said onboarding is a problem. The one issue that matters that I define for them is speak to onboarding. So we say once you sign a version, I want you to onboard them within 48 hours. How will we do that? We will discuss later. And what we do is, these are the things that we talk about. You don't need to read it. These are the things that we are at the logistics. What they did was they took it and they said, he brought it to the team and said, speed to onboarding 48 hours. Then I said, we designed a spreadsheet. We want to break it down a bit further.

[01:10:45 - 01:11:34]
Speed to first 10 transactions is golden. If you are on board then you have to transact. Speed to first 10 transactions. So we have one column in the spreadsheet that they have said. Another column is speed to first 100 transactions. Another column is speed to first 500 transactions. And then we are. Okay? Why do you think you do that? Keep it on top. Okay, that's one penalty. For sure you call this to grow. For sure retention. That's one key. To track how to grow. Is that a poison point? Is it to grow? Yup. Speak to the maximum potential. To give them value as soon as possible.

[01:11:34 - 01:12:23]
There you go. To give them value as soon as possible. Speak to activation. The faster you are, the better it is. I sound like a broken record. I mentioned this a lot of times to a lot of companies. The companies that really get results are unfortunately people that pays me for my time. People that don't value it, they don't do it. but it's the key and i'm gonna make an exercise to you that you're part of your own voice quickly in one speak to value is key what they did was they took that idea further they hire people once the sales team closes there's a different thing once the sales team close they hire people to go straight into the grocery store stand there for four hours teach the merchant

[01:12:24 - 01:13:12]
and if their customer comes in, they move their customer and say down with the app and transact it right now. That's how precise they are. I'll be honest, I was surprised. I didn't tell them there's no choice if I do it manually, if you need to do calculations, and they move this, maybe salary in Egypt are relatively lower, so we down on numbers, and we'd be like, perhaps if you do this, they did it, they go like crazy. So the spreadsheets are there. Another thing is the Speed2XM transaction has a name behind it because there is an owner for the account. Which is your main transaction inspection that is an owner for the account. If the client did not transact the first 25 transaction, or if they transact for the next 25 or next 25 transaction,

[01:13:12 - 01:14:00]
they won't go there or it's too slow, it flags immediately in the inspection where you need to look into this account. So this speaks to the rectification. Okay. Simple idea? Easy? Easy? Simple? It's not easy. It's simple to understand. Not that easy to read about. I think there's one more. B10. B10, there's one company in Kazakhstan, they call Respe, and you probably saw them in Newton. You can look at 500 Euraceous, there's one quote that he put there. We were sitting there and the investor was telling him,

[01:14:00 - 01:14:47]
his name, the investor was telling him, why do you do your onboarding so manually? I say, they say, the investor will tell them you should automate your onboarding. And they asked him, he was like, investors say this because obviously they want to steal. manual automation it's about cost and returns you can automate and the cost might be low but your return might be nothing because you might have churn in fact you're negative so i said you shouldn't be doing that i think you should be doing manual onboarding they took it by heart what they did was they really took the manual onboarding they are a software with hr module for restaurants and their their their their their cost of the

software is actually pretty low $50 per month and they still do manual onboarding them. So look at 500 dimensions,

[01:14:47 - 01:15:33]
you can get in such as in Reski. You can say that he says that what he learned in this program was they did the manual onboarding and they have zero churn. So I texted him and was like amazing congratulations you take it by heart and what they did is that they bid in as big manual onboarding as part of a person's job description and when they hire they say it's part of your job is to make sure that you manage the onboard people. So, the lesson here is I want to tell you, you will meet a lot in the next year, you will tell a lot of stuff. I open my eyes and I always look for people, but by the end of the day, it's cause they're going to get to me. And sometimes the investors, they have never run a business before. So you don't know what's the problem, but it's this. So when you take advice,

[01:15:33 - 01:16:18]
you're going to sue, you have to do your advice. Yeah? Or they give you theories. Here is the reason. Take care of it. Yeah. Here. Yes, absolutely. Here is the reason. Here is the reason. Don't take pictures. I took a risk by screenshotting this from our spreadsheet. When we designed Incentive Plans, we were here. You can see that the graph was like here. Incentive Plans help them to grow. and then after things are left in a minute they just shot up we're in a recent PC we say right now okay in the VNP is it GND? huh? GND?

[01:16:22 - 01:17:07]
is it revenue or gross transaction gross transaction amount of transaction amount of transaction gross okay I cannot disclose revenue okay yeah yeah yeah please don't take pictures transaction gross so when you look at this graph emphasize it when you design your workflow your experiments or when you onboard your new high or when you onboard your new employees one critical mindset you need to have is how do i help these people to get quick wins in the next one month or two weeks it's quickly important because they're not going to wait for you they want you results right now sometimes in life you'll get results all the time, not immediately, but it doesn't mean that you cannot get small quick wins

[01:17:07 - 01:17:54]
because that small quick wins in early stages of your relationship is going to pave way for the later stage of your relationship. Nobody argues with good relationships. Do you sense? Which is why I want us to start right now because if you don't start, you can't start with marriage time, right? Same for the person, you can't hold it. sometimes that one small stuff is going to pay way to a lot of growth. okay? alright. okay. I don't want to know how it works, but I think I'm almost done. Here's the next thing. And this leads to the things I just talked about. This is the question we need to ask when we design our product. By the way, just reminding you, in every of the finest popular company, there are mostly tech companies.

[01:17:54 - 01:18:40]
as I mentioned I'm not going to tell you how to do a product because you're probably vastly different by the companies I want to tell you this your product is for not only tech your product is also the human element it sounds kind of unwinded because you probably heard like oh there's a lot of like companies why they built like a big sphere like one billion like whatever months yeah whatever I've not built that company before I can't tell you whether they're right or wrong but there's also outliers in every single market. Would you be able to copy them? I hope you can. But I think for the first couple months, they spent $10 million, almost burned all of their money. Yeah. To buy a car market that they have. If they have, for example, American company, they have excessive capital that they don't have in this region.

[01:18:40 - 01:19:29]
So, again, everything's contextual. But my point here is I want to remind you that if you see your product as only technical point of view, try to expand the horizon. Because I think with AI, yes, there's a new law I think AI is making human connection even more valuable because information becomes a commodity. So you want to take that into your flow as part of your product, how you service people. Your team, how do they talk to your customers, how do they onboard them, things like that. And especially in the market where they value a lot of human connections. The medium-east market, for example, the tech is there, the tech is everywhere, but you gotta talk to them. I mean that's why young students who are dreaming to shake their hand when they want to shake their hand.

[01:19:30 - 01:19:59]
So think about your product from the perspective of human and human human as well. The first question for example in the case of flash when we map up the product We always ask this question and by the way when you design your product we should ask this question as well. What is it that you need to do to get the outcome for your clients? What is

it

01:20:00 - 01:30:00

[01:20:00 - 01:20:47]
that your product need to do to help your clients get the outcome? You want me to repeat? We are not thinking about your product feature, forget about product feature. Ask this question. What does my product need to do to help me get the outcome that they want? How do you do that? First, you grab the paper and you plot A to B. A is where they are right now, zero. B is the definition. What do they want to achieve? what you want to raise your mind okay i know you guys already have a product but if you sit down and you think about it forget about the product and just draw a paper i think you'll find a lot to do inside a to b right now and then you put one line and you ask this question every single step they need to go through they need to go through from a to b every single steps what is it that

[01:20:47 - 01:21:37]
they need to do to get to the outcome that you want okay all right and then you start plopping example for this let's say my goal here is to for flash to get merchants to increase transaction okay that's my goal i want to get them from not a lot of transactions to a lot of transactions okay my product is my expertise in this case my expertise okay i don't have physical product but it's my experience okay i plot them first they need to sign and find the same merchant good that's what they did already second they need to do technical avoid that's the thing too well then one that once that's being on boarded they need to do the transaction five five times in one day five times seven days whatever and then they need to transact okay

[01:21:39 - 01:22:19]
simple right simple yes then what we do is what i taught last week we start the sign in daily gap first step is number of merchant signs second step is speed to onboarding in terms days third one is speed to 100 transactions next one is speed to 1000 transactions next one is speed to whatever transaction by the way this is wrong because i say transact 5 times 7 days and i'm there i say 100 but you guys get the point a to b map it up where you are right now the ideal stage that you kind of want to get to and then you chop it up and say what do they need to do to get there and for every single step you start assigning api why do you assign api

[01:22:32 - 01:23:17]
So we didn't focus on for example number of merchant signs, we focused on speed to unloading that's all and the rest downstream. Then we start doing experiments. Okay, and we say, I forgot this, I forgot to mention this. In the first two weeks of implementing the incentive, something really interesting happened. Muhammad told me that his team, he has 3% at time, by the time he finished he has 10, so he grew the team around 3 times. So what happened? What happened? When we started the engagement with Muhammad, he started with only 3 team members. But he grew so much, he tripled the team. And one thing that he told me in the first two weeks, once we implemented incentive line,

[01:23:17 - 01:24:06]
he called me and was like, Nick, I want to tell you something. He was like, last time my team will only follow up with my merchants once a week. We call. Once a week. After incentive line, they call twice per day. I was like, shh. I was like, yeah. They usually start calling the question twice per day. One and three. You transact it already. You have to transact it already. Incentive changes people's motivation. We unfortunately not going to talk about incentive here. But incentive is a big topic. How you design it. How you work with your team members. How you motivate them. Without you trying to push them too much. So we ran an experiment, once followed up a week to twice per day because of the incentive

[01:24:06 - 01:24:51]
and we also gave the merchant incentive plan. We designed a plan that says if we transact a lot more we give you cheaper rates. So to get the business going we incentivize both ways the team members to get it going, the merchants to get it transacted. Okay? When do you want us to remind about how they killed the law of the team? Ah, I'll come back. That would be a nice story. Are we good so far? Yes. You guys see how I linked the previous presentation together? The product process, this is the process, the product process, and then we assign KPI and then we run experiments.

[01:24:54 - 01:25:41]
the next thing is you can see here in terms of AR is we should just say. Again, AR is discipline, helps you to see where you focus. I get the value for flash. Yeah. Yeah, the more transactions, the more they earn. What was the value that

you're trying to give to your client in this case? More transactions or more? What was the mean they were promising to do? It's an easier way for their merchants to take money with the app. That's one. Because they're using a lot of cash in DJ. It's just an easier process. Second thing when it comes to an easier process is that they have incentives with low transaction rates. So these are the two things that they're offering.

[01:25:41 - 01:26:26]
I think they might use some of the things that they're offering but not 100% credit. I didn't work on the product by the way. They have a lot of product. improvement that you want technical perspective. But Flash is a payment processor or payment gateway? It's an app. I don't think you guys have it here, but it's an app where you can use the app to transact. It's like to receive the payment. To receive, but the very clients is regular people who want to sell something. regular people need to download the app to pay and then the merchants need to download the app to receive right, which one they have it's like a point of sale it's like what?

[01:26:27 - 01:27:16]
it's like a point of sale yeah, when it happens, yeah and right now I think they have a PPSCO POS as well, that's the next idea okay this is the spreadsheet that I talked about okay they have this, we streamline the spreadsheet, we have verticals I'll come back to the story. They're vertical, they have food and dining, electronics appliances, accessories, whatever. They have launch dates, when are we launching, account size, salesperson's name and also the account manager's name. We're so precise that everything is documented and then we talk about every GMB per day and the key here is day since last transaction. So if it starts to they start to slow down on transactions immediately notify the PM

[01:27:16 - 01:28:00]
that come in and say you gotta call off to that so everything is all on the street okay and you can see day since day to five transactions there's a 10 transactions etc by the way sometimes some some part of it is not complete I think they lose today whatever but you get the point this is the especially I have created for them. Okay? Alright. Okay. Let's go to the next thing. This is more like a quiz. If you want to go to a hotel, what's the process you need to go through? Okay. I walked into it. You select the... assuming it's a goal there, right? You select the location, dates, you know, and then you say what are the criteria. Is it the... what's the budget? Is it smoking, mal-smoking, whatever?

[01:28:01 - 01:28:43]
you put your customer details, you complete the checkout if there's any add-on, you can send up sales and if there's any comments you receive by email. Simple right? Okay? Then what you do is that if you want to optimize this business, you start assigning KPIs checks on part of it. Okay? Conversion rate, time to add the cart, how fast it is, the details completion rate, checkout completion rate, except the machine range the rest easy i'm just telling you like the same concept how you apply okay then you start doing experiments and you sit down these are things that you guys are going to right now make sense and then these are the ar okay what is this

[01:28:48 - 01:29:41]
This is the business that I created, the one that went for 518 months. This is the process that we created at a time. It's a program that shows people how to build their own business. It's a program, mentorship program. We charge by 7500, and then Ubuntu 12500. This is a process that we go through. First we sign the time, then onboard them, then after that we say you've got to book a call with whoever, your mentor, and after that on weekly basis you basically jump on an online call and then from there you meet with other experts, etc. Then also there's physical events as well and lastly there's a monthly check-in with the customer success management. This is a simple process. So when we started, I would say the last one and the second last one, we don't have the process.

[01:29:42 - 01:30:00]
Yeah. But here the result is still kind of, I assume they would love to have increased value. Yeah. So this is not there. This is our perspective, not the other perspective. From our business perspective. Sure. The other perspective is they go through this as well, but in different

01:30:00 - 01:40:00

[01:30:00 - 01:30:47]
lengths. Same thing, the KPI. Sales team, how many clients sign, onboarding goes back to the client success manager's role. What is your speed to onboarding? What does it speak to first call? Product wise, we use NPS to define. and then at the end renewal is one of the key for the classifier success manager. Do we have all of this mapped out in the beginning of the business? No. We mapped everything out after probably one year and a half of the business. Why? We were too busy executing. Is it mapped out in the green? Yes. Is it like this in execution? No. The reason why I'm telling you this is because I think as mentioned by Duterte,

[01:30:47 - 01:31:32]
a lot of us here are perfectionists unfortunately it's not perfect business i also perfectionist at one point in life perfectionism really kills my progress because i can't move forward okay so when we started in the first probably one year the only take care we focus on is actually how many people we sign on as attackers it's all about sales and then pain keeps saying you've got sales or you're starting to get refunds or people don't want to continue with the program. At one point, we ran the number with the CFO, and our refund was probably 8%, which accounts for probably 100, 200 grand a year. So we say we started defining the matrix that quarter, and it's the FCP. We have to increase the refund.

[01:31:33 - 01:32:19]
We have a fortune to hit the target, we did it in two months, so a long month to leave. The refund went from 8% to 10%, 3%. We saved 200%. only thing that we focus on is that we speak on. That's all. Okay? And then at the end we say we want more money, we want to get them to be money. So we put an incentive to the plan success manager and say if everything we want, we give you 10%. So the cap is fixed, but when they renew, our cost is only 10% and we basically 90% of everything. So we'll come back to the beauty comics part. How do you play along with the numbers? OK? Last one. This is what people think product is.

[01:32:20 - 01:33:05]
OK? This is a pack. They go from A, they go to B, and it's a feature, feature, feature, feature, feature, feature, feature, feature. OK? This is what we have right now. Product also includes experiences and also stories and success. If you notice there's one thing that I don't know whether or not you guys pay attention. Mentors in this program often talk about success stories or case studies with you. Do you guys notice or have you ever... Sorry, can you repeat? In this program, mentors have kept talking about success stories or case studies. Did you guys notice or? Noticed not. Why?

[01:33:07 - 01:33:53]
Why we noticed it? Why do we want you to have success to result case ID? Because it's about trust. It's about... We need to be first. because it's about trust, it's about... in our case the most common objection is that although I'm sure that it works, I'm sure that my users will talk to the reality of action and for us this case study is evident that first it works and secondly it brings the weather It's the most important thing for us and we put a lot of effort to create this database.

[01:33:54 - 01:34:39]
And we open our eyes to see if anything is possible, that we did not make this. You guys are correct. The key at your stage, why we want to successfully pay-sending is you need to start putting your product and deliver what you promised to deliver. Let's assume your product is perfect but if you don't have success case study, what's going to happen? I think it's one of your experiments to collect. What's going to happen? What is it costing? You just continue to be speaking about your product, but not the market itself. So it will not hear the kind of thing.

[01:34:39 - 01:35:30]
So they, they. Yeah. Comes back to trust. Yes. That goes back to one thing. People like her a lot of times, let's talk about pictures you guys already know, but people are very hooked by stories. I don't know if I do it well. Maybe you guys can give you feedback, but I think my presentation is a lot of stories. That show you exactly like what happened, real life, what was coming, what is it like. with this as a product. So with your product will be the same thing as well. If you don't think in early stage your job is to make sure your product does what we promised but actually early stage a lot of companies and it makes sense is to get more revenue in. Sure completely they don't conflict but at one point your revenue will start to stop because your promises are not being

[01:35:30 - 01:36:16]
reflected in a way where people trust you. That means at the top of the money people you start to because there is no story to take the next level. So what that means is that it forces you to think about how you can organize your team, be it the product team or the technical team, to orientate your workforce to make sure you get the results for your restaurant. Because if you don't have it, you can raise up having much money. At the end of the day, at one point, you still need to deliver the results of your product. Because without that, you're not able to grow. So you can continue growing your top line right now for meeting. but the biggest thing is your downstream impact the hole that you've got to plug is to make sure you deliver the results for your questions that's how you scale that's how you get it it's a process a to b if you get people to b and they

[01:36:16 - 01:37:06]
create a success case study the success case study will go into your acquisitions on your website where you will attract more people so it's a look okay this is fashion lab 29 this is what i screenshot this is what is from one of us what's up Camila say one of the biggest learning for us this year Paul Golding is everything they are a fashion AI tool they're from me now okay so they're curious about AI but getting them competent enough to start creating whatever okay takes hand on us we're spending a lot of time right now thinking how to monetize that later okay so it feels like our positioning will end usd are becoming clearer okay understand this is the onboarding v9 v10 i've already mentioned recipe is one of the

[01:37:06 - 01:37:54]
go look at everything i keep on find this thing you guys can look that's that's that is what he said so onboarding is a big experience but not only that part but the whole experience is critical If you guys really push like flesh, which is what I recommend to me like, you will have to quickly check in with your colleagues. Same, at an early stage you have to check in with them. We are telling you a lot of stuff. You would rather spend your time there at an early stage, avoid that at a bigger stage, that you don't need your customers and you have to put more money into acquisition that don't matter. so doing the early stage okay i think this is the last one golden gap golden gap is a concept

[01:37:54 - 01:38:39]
that says this is a different lens of looking at product you have something your client has a goal okay so for example in b8 or b9 okay they have an ai team that coaches people mostly restaurant about the restaurant processes. The AI is generic. Your agents can do a lot of stuff right now. It's up to you to know how to define. So one of the problems that they have is that you can do anything, you just don't know. You can do anything. So I get pricing lower or whatever, I can do any product with my client. That do anything is also a problem because the client doesn't know what you can do. Okay? So the other goal is to, for example,

[01:38:39 - 01:39:30]
that case is to have an employee training solution for restaurant. So what we did is that we mapped it out to say your client wants to go from A to B. They want to go from not their employee going through manual training and everything to becoming faster and being skilled up about your restaurant's manual and also your operations quickly. So B is where they want to get to. They want to quickly onboard their employees. They also want to quickly help their employees to skill up. So we map it out. We say first one is you onboard them. Second, they need to learn the menu. Third, they need to learn the etiquette. Fourth, they need to learn how to work with the team. Fifth, take orders, upsell, downsell. Next, pages. That's the process. But the problem comes here. These products can do a lot of pages.

[01:39:31 - 01:40:00]
So how do you sell these full packages to the customer? Do you find out how to sell them? So one of the things that the concept that you guys have put in mind is because we have built anything right now, it doesn't mean you can sell anything. You need a certain focus to talk to your clients and say you can actually do this very well. The concept is called the golden gap. Okay, the golden gap means when you look at the whole process, by the way this is not a gospel truth. it doesn't mean for example you

01:40:00 - 01:50:00

[01:40:00 - 01:40:44]
have is your your belt proposition is end to end that's your better proposition but you also need to find ways to figure out like what is the end to end because that's not the end to end tool right now golden gap is a concept where you only create a product while you focus on one part of the whole process okay so for example maybe this tool for this tool is all about taking upsells and downs up you teach them how to take upsells and downs up Okay, maybe you don't include anything in everything. As a stock context, as a stock, to have a wage or to have a one point of focus, you can tell time, my tool needs this, they don't have seven, they have seven. They just justify. With this, it's gonna cost you only about $2.40,

[01:40:45 - 01:41:40]
but the more they can take ourselves, the rest of our seven, we probably need $200 more. So you're not trying to solve all the problems, you're only trying to sell that one part of the pound and you go to the bank and say i've sold that one part of the pound okay makes sense and you can actually charge higher for that this is a concept it is applicable for a lot of different companies the problem with us with our tech is that we can do a lot of things but for example the cash with the prospect we are doing that can do a lot of things one recommendation would say you have to go in with one thing that you sell them I can do this thing for you real quick at this price and then once they use your file then you can upsell later yeah, does it mean that for us that we should sell to our clients for example build selling websites from one prompt

[01:41:40 - 01:42:31]
and all other functions will sell them upsell through the internal processes. That's one of the options but I don't think your clients are about reading websites. I don't know. Hypothetically right? As an example, you can, but it's a test. We don't know. But for example, for us, when we were watching our other companies, we were not at the same age, they were trying to do it and they got a lot of traction and users, the easier stuff. If you try to sell, for example, buy big CRM systems, etc.

[01:42:31 - 01:43:17]
Most of the people don't understand it. But when they are trying to build it, they understand it. Like an example, you should do A-B tests. Yep, you can. Open gap is a concept. Do you need to use that concept? Yes or no. It's worth the test. but one of the dangers that we have is that we are because building is easy right now it's actually quite generic because everybody is saying the same thing so we go back to just in this teaching market sophistication everybody talks about the same things what do you do what do you do I'm refreshing you about your market knowledge guys I'm getting into thinking

[01:43:17 - 01:44:04]
you're not thinking, you're not taking away, you're caught implementing. If everybody in the market is telling the same thing, what do you do? If everybody in the market is telling the same thing, for example, if you have any websites, what do you do? I mean, you always try to do the same quality as we do, but they are not on that level. Like painting that tracks of the app, you know. Yeah, but they don't know on the page. So what do you do? Marketing tests. Of course, now everybody talks about the features. We talk about other stuff. Yeah, well, yeah. So, a few things you do.

[01:44:04 - 01:44:51]
One, either you narrow down the ICP. That's one option. Second, you narrow down the building head, which is what is the one thing that your product does very well. You have that one day. Okay. Third, that's more long-term that you can build more around it. This is your success case studies. To tell the story from your behalf. I'm pretty sure that a lot of tech companies, they don't have these success stories that tells the story. from customers perspective that helps us out so when we have that I think we have SDR as well. Your website has a lot of resources. Okay. This was very important. So, thanks. You either narrow down your ICP and you talk to them while ICP is stuck with.

[01:44:51 - 01:45:41]
Yeah. Second, you narrow down your features and say this is what I do best of all features that I have. I don't know what I do. All the features, not out of the because we can tell we have no, no, no Can you tell that we have a nominal enough words and that this will be a golden gap? You can, but if this is your golden gap, can you try to solve that gap? For example, we didn't map out this thing in our first office hour. The process is that huge. Which part do you want to really do? Otherwise, you try to do all parts. Even if they exist, we talk about all this part. Yeah, right. So that's that. There are five common mind spots. One is you think that you must build up a full stack solution right off the bat.

[01:45:42 - 01:46:27]
Ideally yes, but life is not ideal. So you need to make sure what you have right now. I think John Ross, you mentioned that the whole package is still mine right now. Perfect. Yeah. So for the perfectionism in the room, it is most of us. I think one thing to balance out the affectionate is taking actions. So one step in front, so we can move the second step rather than take one step and try to be perfect at one step. The second one is starting off with teacher first versus mapping the path. For me, mapping the path on paper is more important than developing the teacher. Because everybody talks about developing the teacher, like this one, building is not a problem. The problem is what exactly what we want to do with them.

[01:46:27 - 01:47:13]
Because if you think about it, let's say your software market says we've developed a lot of features but people actually don't use it 20%. So why do you develop so much? Because sometimes people don't want those or they don't know how to use it. Right? The third one is asking users what features they want versus outcomes they want to achieve. Okay? Let's get back to this. You can probably ask both and they'll tell you differently. them what features you want they technically tell you what what outcomes they want to achieve already so either way but you gotta understand what is the motivation that they have fourth ignoring data we're going to talk about it the last one is liking this execute right this okay common kpm news um i'll briefly go through it but you guys probably have

[01:47:13 - 01:47:59]
your own news right now a lot of ai stuff but churn leading versus liking and catering okay What we want to figure out is how many paid users stop using a product. Dropbox, you guys have the tool to figure it out. But you guys need to figure out your churn. By the way, I think I vet most of you. I vet most of the applications for all batches. The first one, right? When people show me the product, the first question I ask them is what is your churn? I don't ask about other things. I ask about the churn first. Especially for AI users. Because by looking at terms, I know whether or not people are using a product. Second thing is time to results. How fast your customer sees your results. How do you track yourself? How do you track them?

[01:48:02 - 01:48:46]
Time to results. How do you track the data? How do you track how fast your customer can see what works? What do you see in analytics? We can see how, for example, for us we can see the number of engaged demos were applied and for us we can see how often they use this product and how deep they use this product. What's the problem with that? You don't know the names? You don't know the time that went back? Okay, that's one. What's the bigger count of 10? You might know. On the individual, you don't know because it's a game.

[01:48:48 - 01:49:36]
What? I didn't tell it to you. It's a Google Analytics, it's a great thing. You can dig into the, like what you do in the whole jar, you know, you can, you know, you can do it in a single session. You can do that because you don't see all the details. Time to results is how fast your client sees the results in your tool. What we talk about is how much they use your tool. It doesn't necessarily mean how fast they see the results. Usage doesn't mean results. So how do you track results? How do you track results? In our case, I think we will track this. It will be the time from the moment of signature of contract to the moment they upload the majority of their users.

[01:49:37 - 01:49:59]
So in our case for example, one of the customers, now we see that they just sent us an extra case of 160 users as well, but it took them things, so it's long, they didn't do it. Yeah. And the results, sometimes when you help us

01:50:00 - 02:00:00

[01:50:00 - 01:50:43]
think about the issues. In your case, yes. Your case is easier. But for a lot of cases in this room, unfortunately the best way for you to know is actually manual. You have to talk to them. You have to hand hold them from the beginning. I tell you that your sales team or your CSM team, if they haven't really talked to you, they have told you as a co-founder, the exact cases of your clients, perhaps you will just start. they need to tell you or the whole team. Our client which is P and P W C. The first result that you're getting is here at this time. This is what they want. The second result that you're getting here is exactly what they want. If they don't know, they can't tell you. They're closing sales.

[01:50:45 - 01:51:34]
Okay? For example, for us, because our results are pattern after the scam, for example. so your result will happen

after the change. So we should measure this time from the first touch with the customer until the first scan. No, until when you define whatever results you define and you get them. If it is stress, let's say you say, let's say the sleep score is 96 is the target, we have 76 right now. How do you resolve this? How fast do you get into 96? use. For example, results and also we just see your HR for some people. But that's micro into one feature of your product. What is the product trying to achieve for them? That's the biggest result as a whole. Scanning is not a result. If you are only

[01:51:34 - 01:52:24]
selling scanning, perhaps, then you have a better proposition if you think about it. It's hard to do what you do. But that's not your business. It is not a whole, for some people it will be just that one thing. Yeah, but I don't think that's a distance. This is going beyond that one thing. I know, I know. But for example, can that also be... I prefer not to. I prefer we push one more. Or a jumper. You ready? Yeah, I showed up to your slide. We use a lot of different projects but a few weeks ago we started testing post-talk, it's more BI-native and easier. Okay, up to you. Post-talk is much better. Sure. By the way, through this recommendation, do whatever you want, but you guys get the concept, right?

[01:52:24 - 01:53:12]
To me it's a tool. Alright. customer effort score I don't think anybody measures this how hard is it to use your product it's a good major I think I should ask the question how hard or how easy it is to use your product you send out a survey and they fill out the survey and also lastly is NPS NPS is in general, you're asking them how likely are you to recommend my tools to other people, which is kill and hurt your brother. As an FS4, I think some of you should implement already. Because if they tell you that it's actually hard, that's a top level scoring you have to do. Maybe the teacher is not what they want, maybe it's a part of the magnitude.

[01:53:13 - 01:54:01]
Tools, you guys have it post-hoc, but I think I'll give you a start. Okay, homework, this one we don't enforce, so I was looking to do three things. One, I think you should map out ICP matrix, the table, the matrix that we talked about. Try to organize ICP that way. You have multiple ICP already, but you got something in your mind from this section at 1, 2, 3, 4, 5. But map out the matrix, you can see which one is a 20. Second thing is that map out the product role in terms of ARRR. and see what are the actions you want them to take to get to where they want and figure out where the gaps are. Some of you might have already known. The last one is highlight the goal gap. This is optional. If your product wants to sell them one thing as a start,

[01:54:02 - 01:54:50]
for example, if I believe is more on a product towards a test room, then you want to say that is basically my goal. I want to solve that one small problem that is a huge problem with my product. Okay? So that's it for my presentation. Can we get out of the moment to see how to feel the losses? Oh, yeah. OK, any more questions before we answer that? Do you have any templates, please? Huh? Do you have any templates? No, template. Template. Template? No, template is already in. You can just copy it. Or the slides. Perhaps I'll give you the slides. This one. Yeah. This is the ICP matrix. This is basically the process, map it up,

[01:54:51 - 01:55:40]
coding that will be the same thing as well. Okay? Any more questions, challenges, doubts, anything I can answer. This will last in my last session. So add some weight and I'll get to that point. Any other things? Are you using PulseHawk or which? Huh? Are you using PulseHawk or? My clients are, I'm not. But it doesn't really matter. PulseHawk, I mean, it's just a tool. analyze the numbers. Up to you guys. Okay, we'll go to the story. The payment company is the real beast. They are predominantly moistened. So one of the biggest challenges that they face every single year when it comes to Ramadan is self-suffering. Why? It is because Ramadan people don't go out and spend.

[01:55:40 - 01:56:20]
and say, okay, exactly. So culturally adaptive context. So what we did is that we set down and ask them a question. How do you come up with this problem where this thing is not in your hands? How do you do that? By the way, I'll tell you the outcome. Last year or the year before, we had a transaction plan to get a big branch. And I say, I asked the team, time around is going to be different they ended up going in this is the normal okay i'd say we got how do we do it

[01:56:26 - 01:57:11]
you see very home it's a payment tool payment can be applied to a lot of different variables you have different vehicles you have food and dining you have electronic appliances they also have grocery since the market and one category they have is logistics so people that ships containers they're using transaction so we set down we back the

table simple table on slides i asked muhammad map it up tell me what are the categories of bring girls that are serving so he he categorizes logistics for service and market and then there's some other stuff online transaction So we made a hypothesis, Ramadan people don't go out to spend, there's nothing to do.

[01:57:12 - 01:58:01]
Supermarkets probably go down a bit more as well. But money has to flow, so where does money flow? To work, logistics. When we started at Lutman we didn't know. We say we know these two categories will go down, we need to compensate the other category. So we say probably logistics. So they went and told the logistics company with this time to basically spur brokerback and give you incentives so they have lower payment for transactions. In the end they still go to the market because they focus on verticals that will basically go through that period of time. They turn out into logistics. So a hypothesis was correct. and logistics continued for me during the high season also so it was much more growth in the business overall

[01:58:01 - 01:58:50]
yeah and post-traumatic policy done incomes right so we can do it for post-traumatic so because of this problem you find another like business pipeline also yeah if you think about i don't know if you guys know this but if you think about how i found myself a business plan First thing at a very fundamental level is, I put ego aside a lot. Ego is just one thing to be managed and as time goes by I learned, it's not about right or wrong. Yes, sometimes it's about right or wrong, but it's about solving the problem. Most people when they try to solve the problem, understand this, we all bring to our human beings, we bring a certain human beings into our business and our relationship. like always like this thing don't work, ah this thing is just this, ah this thing is just that

[01:58:50 - 01:59:37]
but when I always heard that the one thing that came to my mind really is I want to find someone that will tell me a different story perhaps this thing could work, I just don't know because I know there's an honest gap between me and that thing okay so I want you to either hire a coach or consultant to tell you that they have already filled in that gap to download the information because they have executed before and can't give. If no one else has solved that gap, that's going to make the hypothesis and the people of the mind. So the very first thing that I think is to remove limiting beliefs and to come solve it. Because limiting beliefs is a good problem for a lot of people. It goes back to the creating story I talked to you about at the time. Right?

[01:59:39 - 01:59:59]
I'm not promoting anything just so I'm creative. But based on my understanding, creatine monohydrate is one of the most researched, top-down is one of the cheapest. If all the folks in the world know about this and implement this, they probably have a better reading process than well. But why

02:00:00 - 02:09:51

[02:00:00 - 02:00:44]
does a person facilitate the solution with their identity? Because when you only need that, anything downstream is not what happened to the risk. You already bought yourself. Same thing for businesses. We know it's a problem for Ramada. It's not something that we could control. You can't control Ramada. It's cultural, it's behavior. We don't control it. What you could control is that you look at it and be like, where do I I ship my resources and pour more in and then we think about the incentive to get into this and more. By the way, we only had one hour in that session. Normally our handhold went through. They just executed me. 3 months later and was like, bro, you stopped Ramada. I was like, yeah, I told you. Other people think it can't be stopped because Ramada is Ramada.

[02:00:45 - 02:01:34]
Everyone in this case goes out. No. At any given point, money has to flow. money people a lot of people don't keep money in the world money has to flow it's just where it flows so let's find out where make sense so any problem solving is i go to the same process first removing limiting belief which means that belief will be challenged you want to be challenged because you want people to tell you things that cannot be you felt cannot be done because if you If you are correct, you don't get anything, but if you are wrong, you get something. That's the irony. Make sense? You know, most people focus on, I'm correct, I look at this data, I'm like, yeah, what data are you working at? Oh, I look at this study, I'm like, yeah, something more about studies, because I want more, like a camera or whatever.

[02:01:35 - 02:02:24]
But it's not about that, it's about, why not these things that help me to move this data, that's what I care about. I don't

care about that. I just want to look forward to those. So people tell me things that I, it's against what I believe but it's going to help me get results. I'll try to help them. And maybe they are correct. And I'm not sure that if you're correct, it's good for me. It's good for you. See what I mean? So I don't know how to tell you, but these are a lot of mindset things. And you just got to work with the people that are going to help you punch through the scene. I can't even imagine this. So these are really like these studies. They did punch through the scene. They did stop for the level. coming back to the question I asked you guys I don't have an answer but if your industry has a natural down period I will think about how to solve that down real. Either you fundle your sales in the beginning of a certain time before summer happens

[02:02:24 - 02:03:10]
either you find a difference in second during summer to get them to still move because I don't believe that summer completely cripples everyone it might cripple the speed might be like 30-40% slower, that's not 100% have not suffered on issues because it is even more acute. Because in Ramadan, based on my understanding, at least my friends told me, they don't work for that one month. I was like, yeah, it will work, but it doesn't mean money will work. A lot of people can be self, but if there is something that cannot be self, usually, but people don't, they haven't done, they haven't think about it yet. Things that are in your control is a lot. But if you pay attention to how most people speak, Yeah, it's not a good job.

[02:03:10 - 02:03:57]
Yeah, people want to take a job because you can follow something. OK. Any other questions? Thank you for reminding me. I forgot. That's what I see. I want to really want to see this. For example, we were dealing with all seasons for five years. So it was really really long for us. And then I would know that we always do a lot of business. Yeah. You're in e-town, quarter 4, quarter 5, you know, it's a lot of money. Quarter 1. But other quarters, it depends on what you're doing in that quarter to track yourself for the last few quarters. That's your job. Also, because of the trend lines, we found that about miles to last season, it was better than like Friday. We found a new way, cloud lines, even more than like Friday.

[02:03:57 - 02:04:41]
So because of the trend lines, and we wouldn't have never assumed that that was going to only through day classes. Yeah. And that. And that. Yes. Sounds good. Very good. You guys do a good presentation? Very good, very good. Yeah. I would love to. Yeah. I think it would be good if you spoke more about the mental stuff. Which one? Like the mental side, I think, is so under-tossed about the business, like the mental side. and I appreciate you talking about that, if that means beyond important. I can talk to you more about how they're about to solve, a bigger thing in the world. But I know we have another conversation.

[02:04:42 - 02:05:31]
Okay, we're good. Any more questions, thoughts, anything I can answer, anything I can help you with? In general, actually, I have to... I think about how can I create this incentive plan for our customer success manager because I believe that he can improve his situation and so on but we cannot pay more money we can allocate some equity Yeah, some equity but first I need to understand if it creates scheme.

[02:05:31 - 02:06:19]
So one thing I forgot to tell you guys, incentive plan is a variable cost, it's not fixed cost. Which brings to your strength because you only pay what people deliver. yeah okay so what we did was with the payment company after six months we did do a review and we did do a vaccination the number that we ended up was every dollar that we paid out the incentive to the account managers we get that four dollars we have more so i think right now incentive time is not a big cost I think if I were you, I would just go ahead and design something and I would incentivize them to create a success story. I would pay them for example one time for that story, even if it's a big one.

[02:06:19 - 02:07:04]
Because I treat it as a marketing acquisition cost. Because these stories will be built up on my website, my home and everything else. So I treat it as an acquisition cost, which you will happen to get there. Okay, I got it. Yeah. Anything else guys? No? So, Mario, did we ask the team to do a survey right now or do a survey later? Later? Okay. You guys good? Very good. Okay. That's it for my presentation. It's going to be demo. If you guys have any questions, we don't just ask and we'll promise off. Thank you. Yay, I'm on time for the first time.

[02:07:34 - 02:07:37]
Thank you.

[02:08:03 - 02:08:06]
Thank you.

[02:08:39 - 02:08:42]
Thank you.

[02:09:11 - 02:09:14]
Thank you.

[02:09:30 - 02:09:43]
I do, I do, I do, I do, I do, I do, I do, I do, I do, I do, I do, I do, I do, I do, I do, I. I.

Session 2: Sales demos and workshop

Source: GMT20261001-090151_Recording_1920x1080.mp4

Recording duration: 01:30:32. Times below are local to this recording.

00:00:00 - 00:10:00

[00:00:15 - 00:00:59]
Thank you. Thank you. Thank you. Who's ready for a sales demo? Woo! Full of excitement. Who's excited to go home and not to run through the edge of the day? every single day and actually gonna use all the things you've learned. Yay! Okay, great. I think this is our last lecture. I think we should have a wrap up tomorrow. I think we should have a wrap up tomorrow, so I think will be your last lecture, will be this one. So you probably have two sales demo blocks, because today I'll be talking about sales demos, and you'll have a little time to kind of work on them a little bit, and then tomorrow you guys are gonna have

[00:01:01 - 00:01:45]
You'll have about 15 minutes each. So that's obviously not much time to do your full demo, full conversation. But the same way that I was up here with the customer discovery call, we'll do it the same way where I'll be your customer, right? And I want you to pick part of the demo that you want to do, that you want to practice, whether it's beginning, whether it's showing some functionality, talking about the end, what will look like. It doesn't matter if you want to practice tomorrow, just pick what part you want to and then I'll have five minutes to see if I can. Yes? OK, great, fantastic. OK, sales demos. What's the goal of a sales demo? Shell. Shell. Shell. Connect. OK, what else?

[00:01:47 - 00:02:33]
Shell will be a different. It depends on the sales cycle, the product, or the .. It could be a sell right now, after the demo, We want to make their pain feel concrete, right? Say you have this problem, you have this pain, here's like what this looks like to fix, right? It's fixable, it's not a problem we've done, not fixable. Show the outcome that they want, right? Because we learned the discovery, what they care about, we know their pain points, we know their problems, and we're going to show them how we can fix those things, right? That's the goal. Not to show all the features that you possibly have, to prove you can deliver it, right? It's not just to show all these things we have, right? It's your time to show them that you can deliver on the scale,

[00:02:33 - 00:03:22]
you can deliver on the outcomes they're looking for, you can deliver on the things that they care about, right? Make adoption feel simple, right? What you don't want to do to allow people go into the demo is, is like, here's all the settings, here's all the things you can update, here's all the things you can change, here's all the stuff you can do, and then it feels like a lot, right? You want to make it feel, even if you do have all of those things, all that functionality, right, we don't want to show that in the demo. That's for onboarding. At the beginning, at the demo part, you just want to show them how simple it is, how easy it is to use, how quickly they can get to the outcome that they want, right? And you want to earn a clear next step, right? Whether it's on the call, whether it's you agree that you're getting a report together and you're sending over a contract, whether it's to set up another call conversation to talk about a proposal, whether it's to do another demo with some other stakeholders,

[00:03:22 - 00:04:07]
you want some next step at the end of your demo, right? It can be any of those things, but it has to be one of them. OK, common mistakes that happen, which I'm sure you've seen in some of them, as you see. Maybe you're doing some of them. Turning the call into a monologue, which also happens with the discovery call. When you go on, and I think I said this phrase the other day, show up and throw up. A lot of junior reps show up on the call, and I'm like, you talk for 20 minutes all about yourself and all the things, and all about the product, and things all the same. Right? No one's paying attention to you when you start talking like that. 50 slides talking about your company. Here's what we started. Here's what we did. Here's what we did. Here's what we did. Here's what we did. Here's what we did. Here's what we did. Here's what we did. We don't want to do that either, right? No, I'll take a couple of demo and sit through a slide deck and see these slides.

[00:04:07 - 00:04:52]
Showing too much product, right? You want to show what the person cares about. And we talked about this in the discovery call. Point up the discovery call to understand what they care about, what their problem is. And the demo is

to connect to that. You're showing them how you solve the problem. You're not showing them all the cool functionality you have and if you're the technical co-founder or the technical one You are more likely to do that to just show all the features and stuff you built because you're very excited about it But don't do that right? Explaining features without value. Here's this feature. Here's this thing. Here's this thing we're doing We don't want to do that either. Ready to ask questions. No storytelling. No control of time. Asking any questions. Why is that a mistake? Any questions? What do people use to say?

[00:04:53 - 00:05:39]
No? Any questions have like one category. We want to continue with our questions. No, you want to have questions, but you don't want to ask. If you ask, do you have any questions? Right, the default answer if someone asks you is no. Right? Do you agree on this? Right? What else can I show you? Right? What else can I show you? You mentioned like this problem. Does it seem like it's solving this problem? Like can you imagine her team using it? It is amazing. And we'll have like, I'll have examples of this later, but like you don't want to ask the CSR question. The default is always no, right? It's the same way when we talked about like, is there anything else that we can add to the agenda? Right? The answer is no. Where you want to say, what else can we add? Right? What else can we add on your end? Because it's more open, right?

[00:05:39 - 00:06:27]
And then I have to think about something, and be like, oh, there's something I can think of. But that is more than just no. Because the default for everyone, it's just like, oh, no, there's no. It's fine. Just keep going, right? And it was made next steps, right? You want to get some direct action at the end of the call. Right? We don't want to get, okay, let's circle back next week. We're going to talk internally and follow up, right? We don't want any of that at the end of the demo. And importantly, right, you don't want to back up with your product fails, right? Inevitably, something will happen with your product. And there's going to be something that happens where you're like, oh, no. Like, something's not connected. Your engineering team did something. You didn't test something. I did something, and it broke. Now I can't show you this thing. Whether it's some images, whether it's something on another server that you have, have a backup so you're not just like, uh, I have to do when your product fails, you know, it will fail.

[00:06:27 - 00:07:16]
There's not one cell person who's had a demo where they were trying to show a product and something hasn't gone wrong. Right? But have some backup or make sure you know how to navigate around it when something goes wrong with you as well. Yes? Questions on mistakes? Then we're going to go into more things. We've barely started. Okay. Here's what I want you to think about. When we're looking at engagement of your customer, right? We're looking here and we're looking at engagement over time, right? And we're saying, okay, our customer comes on the call. We're really excited. Everyone's really excited. They're really engaged. They're like, ah, I get to see something. And you're like, yay, I can't wait to show you all the things. You're both really excited. And then if you go into your monologue, right, and you start talking, and you're talking, and you're talking, and you're talking, and you're talking, and you're talking, and your customer is like, bleep, like, oh, did I get another email?

[00:07:17 - 00:07:46]
you're just talking at me and not paying attention. And you're still talking because you're like, everything's so good and great, I'll actually do this and I know you're really excited. But that's what happens, right? If you're the one talking, talking, talking, and they stop paying attention and all this into you, right? They come back to finish, they didn't really get anything on the demo, they're like, I don't know, maybe we'll follow up later, I'll talk internally, thanks for your time. They got no value from it. And you feel great because I'm like, I just talked to you about all the things, you obviously love it. And they're like, I didn't love it. But they're not gonna tell you they didn't love it, right? Okay, so this is what we wanna think about.

[00:08:00 - 00:08:49]
We don't want this like silent drop off right and then I'll do a session I think in two weeks on onboarding but this same thing happens when you onboard a client don't talk to them right there's a ton of them that drop out that you're like hey you're happy you're not talking to me and they're like no I'm actually just not I'm not talking to me not having anything to do with it and you don't know and think I'm happy right this is the same thing um so we want to do for this right when the sale engagement is high I want you to think about the things that you're showing them right the things that you already know based on the discovery call and the questions that you asked them already right am I solving your pain how am I solving your pain how am I showing you that I'm solving your pain right what's the impact of this and hopefully because you asked them the right questions in discovery call you know what they're thinking about for the

impact right and how it's going to impact their team their ppis their goals

[00:08:50 - 00:09:37]
and what that looks like for them going forward right and then can they imagine using it right what blockages can they see are they like oh no you don't integrate with this thing you use of the blocker right like oh i think the ox person isn't gonna like this that's a blocker right can they imagine actually using it having their team using it having people like move forward with this right that's what you're envisioning that's what you're creating for You're creating this beautiful universe where you solve their problems, everything is great, they get the impact they want, their team is on board, and you solve this problem. That's the goal of our demo. Yeah? Okay. So here's what I think about the demo. When we're thinking about it at the beginning, you have prepped. You have prepped for many, many, many of your goals. We're thinking about what was our discovery call?

[00:09:37 - 00:10:00]
What are the things they care about? Right every salesperson is a refresh of like what do I already know about them? What did I ask last time to make sure that I remember what I'm going to say right? Stakeholder priorities are identifying those and then for your demo right we're thinking about the agenda Same with discovery call. Here's what we're going to cover today. Here's what we're going to go through If it all makes sense, if I can show you that we can solve this problem for you,

00:10:00 - 00:20:00

[00:10:00 - 00:10:44]
It doesn't make sense to talk about in a place. Right? It really does. Right? Talk about the agenda. Intros, if there's anyone new on the call. Just a reminder, like, I'm Tima. Go up to the demo with you today, like last time we talked about it, it's Monday. Right? You're summarizing, confirming what they care about last time. Last time on our call, you mentioned you had this, this, and this problem, and we're looking to solve why by this time. Does that sound correct? Right? Sometimes, they will have changed. They're like, yes, it was. hired this new person and our careers have changed a little bit. Right? We're changing what we're doing in the next quarter. And they're like, cool. Then you go back and you're like, tell me about what that looks like for you now. Because that has changed your discovery goal. Right? If they tell you something has changed. But you're confirming to make sure that you're still on the same page. Really important. Right?

[00:10:46 - 00:11:32]
Prioritizing. But based on our conversation, here are the things that you cared about the most. Here are the things that you wanted to solve first. Is that still accurate? Right? Does that sound about right? You're confirming and you're engaging with them, right? You're asking, like, does that make sense? Is that still the priorities that you have, right? And then we're showing value immediately. We're showing something exciting, something feeling, something that they care about, right? And then we're talking about other functionality and features that you have, but you're tying it to value. You're tying it to impact. You're tying it to what they care about. You're tying it to how they can see what that looks like within their team, right? If you have pricing, like you're pricing at the end, right? Now that I've talked about all of these things, talked about how you get this, how you get X, Y, and Z, let's talk about what that comment would look like for me. And then you can talk about pricing.

[00:11:32 - 00:12:20]
And the next one. Yes? Do you always talk about pricing to your demo? No. You don't always talk about pricing in a demo. You can talk about pricing in a demo. If you have a shorter sales cycle, you usually would because you don't want to have another call. You talk about, okay, this all aligns, this makes sense, you want to get started, here's what that looks like. talked about it's five hundred dollars a month right you do this on an annual plan you get ten percent discount if you pay in advance for a year right um that you can do if you are more enterprise you usually or you're doing this now we're talking about things committing you maybe have like an idea in your head um and like their budget of what they're doing and you might talk about it but you usually would have like a follow-up call to discuss like here's a proposal plan based on what you said here based on how many people will be using it going forward looks to

[00:12:20 - 00:13:05]
look like it solves your problem right like you have like a separate pricing call and you walk through like here's what the proposal looks like here's how we do it because you walk through together yeah okay okay so we're gonna talk about mistakes and best practices logistics building demo framework and we're going to talk about writing your script

so that was that like just an overview of like what a demo will look like and what things I want you to be thinking about it as we go through these things. Yes? I'll have some examples. There are a lot of text on here because I want you to go reference examples of how different companies would do it or how they talk about it. Yeah. Any questions so far? I mean for me it's just the only difficulty that we don't have any kind of demo to show or I mean the perspective

[00:13:10 - 00:13:57]
I'm just trying to find how we can leverage this tomorrow. But I don't have anything like that. Well, I think you're going to start with interviews. And I think that will give you some context. Because then, once you've done that, I mean, you could even do it tomorrow, like do some of those easy mockups, right, in a big long run plot or something to be curious what this looks like. You can show mock-ups of things, right? And be like, this is what the product is, here's what it looks like, get some feedback. It's okay to show that, right? Okay, best practices. When we're thinking about things, right? We're thinking about the outcome, we're showing proof that the product can deliver, right? Because a lot of times, there's a lot of companies, a lot of AI companies, that say they can do something,

[00:13:58 - 00:14:48]
and then when someone uses it, they're like, This actually doesn't deliver on anything that you promised, right? And so in your demo, you want to make sure that you can show some proof that you can do what you're saying you can do, right? Especially now, it's really important to show that it's actionable, that it's something they can actually functionally use, and it's not just like a paperwork product that someone says they built, but haven't actually built, right? A simple adoption path and earning a commitment. So some things to think about, right? And I know some of you are at different stages in terms of your demo of where you're at or how you're thinking about it. So I have just some background for the very, very basics of what you do, right? How much to set up and what to think about, right? Having a demo account with data. Be comfortable with the data that's there, right? A lot of people will set up like a staging environment with data that you can go through, play around, and reset back to the original data.

[00:14:49 - 00:15:35]
So you know what the outcome will be, right? You know it will work the same way every time. And you know the data that's there. So it's not just a new data every time or going in and trying to explain something new. So we're thinking about what you want to show, what you want to have, have something that you are familiar with and comfortable with. Don't show an empty dashboard. A lot of people just go in and are like, look at this great analytics that has nothing in it. That's really boring. I'll prompt people into a dashboard right away. Yeah? I think it worked really well for the previous generation of software. AI software is always improved. What do you mean it's improved? I mean that every time it comes straight, because you need to demonstrate AI features.

[00:15:35 - 00:16:21]
And to demonstrate AI features, it's always going to be relied on the LLM. And the LLM's unfortunately are reliable right now. They are not, but if you ask a good question, like let's say last time, when you asked us an example, right? If you're asking a question about like something, a regulation in Hungary, in Eastern Europe somewhere, right? And you ask and you're asking, you're like, every time I ask this question, this is the answer I get, right? I would be comfortable using that for a demo because I know that's the answer that we're going to get about this regulation, right? With a model's change, right, you should definitely see how they respond and write what they do and how they train them, right? using or showing something differently you should definitely do that um but that's more iterative

[00:16:21 - 00:17:07]
right but i would not ask like a new question to like your product in front of a customer that why would you why would you not ask previously about the question for the demo so you're ready and prepared to know the answer will be right so when you're thinking about it you're all in different stages right and you're all in different places and you're all showing different things right like Fuji when you guys are showing a product that's built and you're showing like here's what's been built with Fuji here's different stages and steps like it takes a while to build something you're not going to sit on the demo with them for ten minutes right you're like here's an example of a good product here's like the prompt and how we did it here's the next steps of what we did here's how we iterated this is what it looks like right but you prepared that right they're not going to do it live on

[00:17:07 - 00:17:56]
the call with them and make them sit for ten minutes and wait for a few months right does that make sense so i would think about it from like here's what i can control and here's what i can make sure goes successfully and here's some things i maybe can't control because i really want to show this live and the way that we've set it up like it's unpredictable and give me a different answer every time maybe don't show that if you get a demo with google maybe

show you know you can control that it's going to be successful right i would say like remove as much unpredictability as you can from your demo because you want to put your best foot forward right you don't want to be like surprise let's see what happens right i mean i would want to do that you can do that but i like to manage the process to show like here's what this looks like for other people in the best way that you can see it so i can show you that we're really good right mistakes will happen things will

[00:17:56 - 00:18:57]
happen maybe your product will do some weird things sometimes and that's okay but let's not have that be in the like the demo where you're showing them hungry at your product list right Keep control of the conversation, right? When they're showing things, you'll have some customers that will be like, can you show me this? What if I do that? How about this thing that we do? What if we do this thing over here? Like I did in the discovery call with some of you, right? You want to try to manage the conversation throughout. Yeah? There's an item on show to this board first, but what is it we say? Show first. Show first? So let's say you're showing things to the team and you're like, your biggest pain point or problem was that when you put in instructions to other website builders or app builders, it gives you a very poorly designed website or app, but with, I'm using Poogee, but with Poogee, right, like we, our first iteration is like much closer because we do all the design.

[00:18:57 - 00:19:43]
Let me show you like what that looks like first and you'll be like here's what we put in for a prompt Here's like what a finish out looks like for a customer because you want to show them at the beginning I think that's the most impressive part of Fuji is right you have this prompt and then you put in this thing and it like Create something for you like in a shortish amount of time But something that's much better than like red or lovable with like the design docs and the back end things So when you start from something you raise another full workflow you start here But for whatever they care about, right? They don't care about the workflow, right? If they say, like, it's really hard for us, it's hard for us, for our support reps to keep up with the volume that we get, right? And then you say, like, here's how easy it is. We can manage, like, a thousand conversations at once.

[00:19:43 - 00:19:59]
Here's what this looks like at any given time. There's a thousand conversations of us accessing support documentation and giving your customer an answer, right? That would take you like a few hours to do with one person, but with us you can do it at scale with many people and referencing the exact

00:20:00 - 00:30:00

[00:20:00 - 00:20:49]
documentation they care about right maybe that's what they care about but you're showing them like whatever their problem is or pain point is right you want to show them how you can fix it not like here's here's all what we designed and the functionality features here's the analytics it's like the problem that i have and you're like let me show you what that looks like with us right and it might be a mix of your product and some screenshots because you can't show a thousand conversation at once in your product but you can like visualize it for them right to be like here's this one conversation here's now we can do a thousand of them at once right answering all these questions handling handling all of these dealers that you have um all at one time right does that make sense and so like we're showing some value that they care about first and that's why i said the demo is not the same for everyone the same way

[00:20:49 - 00:21:34]
that you're discovering while you're trying to identify and put them in a segment or in an ICP. So you can identify and show them like what you need to show in the demo. And so if they don't care about the volume, right, maybe they're like, there's this one really specific, hard, complex motorcycle that we have. Right? And they're like, it's not the volume. But everyone always has to go look up all the answers and it takes them forever. And then they have to reference something else. And you're like, we can do this very quickly. Right? And give them access to what they care about, what this looks like. because then like just the speed is more important to them. Is it possible if there are two people showing the down in the co-pandre team? One who is showing, another one who is attracting? Or it doesn't sound very native, right?

[00:21:35 - 00:22:23]
It would be more like if someone else is showing while someone's talking, you would spend more time telling the other person what they should do next. Right? And so it's usually one person who's like showing and managing because

you're owning and controlling it and controlling like the speed and where you go next and what you're showing. From your speed through an agenda. Yeah but you can have the other co-founder on the policy either like take notes or like jump in or like be thinking about what they're asking so they could be like oh hold on one second I want to ask a question about something you just said like pause for a minute let me ask this question right and they can help like think at the same time that you're trying to think but also going through them. Yeah perhaps this is more natural is what I feel In our case, the psychologist one is interacting and product demo was shown by Christina.

[00:22:25 - 00:23:14]
We took some time to switch and you don't feel like you control the job. Yeah, so one person controlling all that and the other person can be asking, taking notes, like reference things, saying like they said this thing and I don't really know how it connects and can jump in and ask questions. That's totally great, right? Because it is hard to be thinking about what to show next and answering questions and also thinking about what they're telling you at the same time. It's funny, but some of our biggest prospects asked us about if our agent can join the sales reps as a sales engineer and show the product and answer difficult technical questions or some kind of system. For me it sounds weird because I can't even imagine this.

[00:23:15 - 00:24:01]
could you answer this question? Would you show this? That's cool though. Yeah, that's cool. Really? Yeah, because then you'd be like, okay, now you don't have to talk to the technical buyer because they're going to go ask and talk all the time. You might get stuck where like if it answers and it's like, no, we can't do that, but you're like, we could probably, we just have to build it. Then you might get some like false name. It would be like, if we can actually do that, and you might just qualify some people. But it is interesting. Yeah, it's interesting for me because I was really surprised by this use case. And it is, I think it works for bigger companies with difficult products where they need to have not only sales guys but sales engineers.

[00:24:06 - 00:24:52]
engineers who can sell. That is interesting. Also, another example about the task room, I'm thinking about yours, right? When you have franchises that are talking to you and they want to see some of your products, some of your things, right? You're like, you have mentioned one of your problems with marketing that you wanted to solve, that you wanted to have an agent do. And here's what that looks like. You can pre-populate a demo for them, right? Of like, here's the marketing agent, right? Here's the things that franchises like you usually ask about and the things that you said you're having trouble scaling. Here's what this option looks like, right? Like this is what it looks like. They're creating this content. They're creating social media posts. They're engaging. They're doing all of these things, right? Like all in like, it took them 10 minutes to create, right? Here's what this looks like. And let me show you how easy it was to build that agent,

[00:24:53 - 00:25:41]
right, or to create that agent. But you're showing them like, oh, wow, something cool first. and then you can show them like and it's super easy to create and do right and we can create it for other ones like receptionist like all the other things you have right? yeah make sense? yeah okay back up short video yeah back up short video the last one back up short video in case everything goes in case everything goes terribly and some engineer changes something and you're like why did you do this right now you broke everything because sometimes that happens. As much as you know you love your CTOs and engineers sometimes sometimes things happen and you should just have a backup just in case you never know what will happen right? Or when you connect you know what happens on the property. Maybe that's an experience you know sitting in the background and just

[00:25:41 - 00:26:29]
launching my laptop. To make sure it works. Oh just having a British sheet of it was like not production. Yeah, yes. We didn't know that. Yeah. Because we're going to make sure it works, right? Because you can't always have your CTR sitting there hanging out with you. So when you don't, just have some backups. Be like, okay, if all the sales be like, oh, it looks like our engineers are doing something, but here's what I'm going to show you, like, I already have things set up. Here's what it looks like. Here's what it is, right? So you can seamlessly turn this into the day, like, I don't know. Let me message them. I'm not really sure. Hold on. you're in a very bad position in the office right just make sure you have some backups hopefully you never have to use them at some point yeah okay um tailors demo before the call starts right we

[00:26:29 - 00:27:16]
talked a little bit about this right um at the end of your discovery or before the demo right you can email your point of

contact to say are there any other people that would benefit from sitting in on this right because then you can hopefully get some more stakeholders and maybe not have to do your your demo multiple times, especially with larger customers. Right? Map them up beforehand and understand if there's any other relationships or anything else they need to ask that you didn't find out from your discovery call. Research people and then research your demo based on what they care about the most. Right? You'll probably have a couple versions of your demo just based on what they care about. Right? And if you're comfortable and familiar with them, it'll be easier from at the beginning. Right? You have your discovery call, but you'll be able to just do the demo if you want. If you're prepared, if you have three to five versions demo that you go in order and show different things based on what they care about based on

[00:27:16 - 00:28:03]
what their problems are then you can do that right okay when to ask for a pre-demo call this is more for enterprise or for large corporations right it sometimes they'll just add random people into the demo they'll add them to the invite um and you're like oh there's four seven new people coming on this demo so interesting that you're doing this right you're like i don't know who they are or or what they're doing, right? It's totally fine to ask for freedom of call. Like, if I just talk to you for 15 minutes, very, very common enterprise, very common in large workloads, right? Now, 15 minutes of your time before our call, I wanna make sure I understand everyone that's on the call, what they care about, what they wanna see, so I make sure that I show the right things during the demo, right? I don't want people to show up and expect to see something and not see it, right? Totally fine to do that. And most people are willing to give you 15 minutes

[00:28:03 - 00:28:48]
to do that, right? So typically, that would be if you are successful Yeah, a lot of people on demo. Or if there's anyone new added, like let's say you look and maybe you had a director level person and now there's like a VP person coming on or there's someone that's an ops person that you're like, I don't really know anything about you or why you were coming on this demo and I want to make sure I understand what you care about and see because I don't want to show up and have you think this is not valuable. They will agree to you. They also afraid that this will go wrong. Yeah, they also don't want to bring other people on a call that goes badly that's like, sorry, I thought this was going to be something else in the book. Right? Everyone wants their time is valuable. They want to get good use out of it, and they want to be shown things that they care about. Right? That they get value from.

[00:28:49 - 00:29:38]
Agenda. Confirm the time at last time. Ask what else they would like to cover. Right? Not like, is there anything else to add to the agenda? What else would you like to add? Right? Introduction. Turn around the new team. Background. Reconfirm what they're more interested in solving. next steps. Building your demo. You can use this lovely little canvas to think about how you're going to add it to add in different things. If you already have a demo, you don't have to use this. This is just for people who are thinking about a demo, thinking about restructuring a demo, right? We're thinking about our pain points. We're thinking about our band. Deema, I know you messaged about like other acronyms. There's like 10,000 acronyms for understanding what they care about. Don't care which one you use as long as you get the answers to them right the answers to what the customer cares about paying to features to benefits right

[00:29:38 - 00:29:59]
because we always want to align our features and functionality to benefits they're going to get don't talk about a feature if you're not aligning it with functionality um moments of excitement potential objections that you might think about that you know and this is something that i would think about when you add new sales people or bring new sales people on having them think through and think about this right or you have to step up for your different

00:30:00 - 00:40:00

[00:30:00 - 00:30:49]
ICPs to say, here's how we think about demos. Here's what you should be thinking about here. Here's what you do next. Here's how we explain and do it, right? Because if you just throw new salespeople on a demo, they're probably just going to do what they're comfortable with, which is just talking about those. Yeah? OK. Benefits over features, right? And when we're thinking about writing our script, right? And we're thinking about the beginning. And this may be some of you are already comfortable doing this, so this is not helpful. I want you to think about and write down and have it listed up for yourselves first of how you want to go through this conversation. Especially if you're a technical founder and you're going through things or you're more technical or you haven't done demos before. You need to think about and being comfortable with going through all of these action items. Because if you don't, you're going to come up here like one on the discovery call and you just jump right in without doing any of these things.

[00:30:49 - 00:31:36]
And I want you to practice doing these things so you're comfortable confirming the agenda, confirming the attendees on the call. confirming the recap, prioritization, and asking what else they'd like to cover, right? If that's what you wanna practice tomorrow for your 10 minutes, you can practice that part, right? Because I want you to be comfortable doing it until it feels like second nature to do it. So you don't just jump in and start showing things, right? Because this is important, right? It sets you up to be successful for the call when everyone knows what's going to happen next, what you're going to talk about, and they feel like they're a part of the call instead of just you talking at them for the call. Yes? Okay, who goes? If you've already met all of them, no.

[00:31:36 - 00:32:23]
Sorry, if you've already met all of them, then no. Just like glad to know when the call, happy to see everyone again. Just like a reminder, I'm CEO of this, this, this. We're excited to chat with all of you. If there are new people and you don't know them and you haven't had the pre-call with them to understand who they are, I would give yourself time to ask. ask who they are because sometimes also people will come on and won't have been invited either. Right? And you're like, this is a surprise. I literally have no idea who you are besides your first name that's on this Zoom call or Google Meet. You should definitely ask because you don't understand who they are in the organization. Right? Make sense? Yes? Okay. Next, reach up and prioritize, prioritize challenges, ask if that's accurate, and then transitions. Transitions are often one of the hardest things for people to do when they're first learning how to do it, right?

[00:32:24 - 00:33:10]
have the agenda, talk about your comfort priorities, and then be like, okay, into the product, right? Like, just think about how you comfortably transition. Okay, now because you said these things, like we have a customer just like you, there's a lot of ways you can transition nicely into your product that leads it into a story that is not just like you jumping into it, right? And so tell a story. You can tell a story that had a customer just like you, that got X, Y, and Z. I'm excited to show you this because you set your pain points for this, which is just like all of our other customers. Here's what that looks like. You're framing and presenting in a nice story and not just jumping into what your product does. We work with customers similar to you. I have these examples here for you to think about

[00:33:10 - 00:34:00]
and think about how you could potentially use some of them or just have them in your mind as a way to do it because transitions are hard. Transitions are hard for a lot of people and it is an important part of framing and it also gives you like another data point to give your customer right for things that you're like I don't know what else I would say this but now in this transition I can say we helped the customer just like them like increase the revenue by 30% let me show you how they did it right not going to know your priorities like let me show you how we help other customers just like you right in this industry in this space right it gives you more data points it gives you more access to them it shows that you know the space that you have with the customers that you're bigger than you are and then it goes into your product and it's also a nice condition yeah okay examples that you guys can look at later but I just want to talk to you and then when we get to our features and

[00:34:00 - 00:34:47]
functionality right things we're thinking about right I want to show you this because of this right I want to show you this feature functionality because you said you had problems doing this and I want to show you how simple and easy it is right um let me show you um i think this is a different one um i had examples for you guys here but i think maybe maybe do you have the other one i think this is the um last match like not that okay it's fine we'll just use this one we'll

show you how severance turns the manual pen testing workflow into a much faster prompting a process you can create and run a testing environment in far less time, right? We want to show you what the value is. We want to show you what you care about, right? We want to show what the value looks like, right?

[00:34:48 - 00:35:34]
So Mybox is an AI sales agent, right? You said you want to increase your conversion rate for 20%. I'm going to show you how I'm switching Mybox and helping you make that target, right? It should be something similar to you guys, right? For you to ask. You want to say, I want to show you this thing because it's going to help you accomplish something, right? You don't want to say, I want to show you this thing cool you don't want to say I just want to show you this feature right I want to show you this feature because of this because I'm going to show you value because I'm going to solve this problem right that's why I'm showing it to you or I'm not going to show it to you right and then questions or things you think about like that you're having as a conversation throughout right you show them something you're like I think this will help you do it here gonna help you increase conversion make this known for other people does that

[00:35:34 - 00:36:23]
That sounds like something that would fit in your business. Can you imagine yourself doing this? How would this work inside your business, right? If you were to do it today, would it solve the problem? Would it help solve the problem that you have, right? We're asking these questions after everything you show them, right? Because we're not showing, showing, showing, showing, showing, and then asking those questions. It's iterative and back and forth, the same as the discoverer's fault. Showing you this thing, it's going to add value. Do you think it's going to add value? If they're like, not really. I don't really see how that would work for us. Then you're like, OK, tell me about why. So we're talking about what you don't like about that. Okay, these questions that the first question is like just to come from because from the first this curriculum we already know their points. So we should like already know if this will solve the problem, right?

[00:36:23 - 00:37:11]
Yes. But this is just like right what you want for the demo is you want them to say like yes this phase, yes this makes sense, yes this feature will help you do this. So then you're like, great, this is what a commitment looks like to do that. Do you want to do it? If you've got me a chance, it's yes. Then if they're like, hmm, I don't know. And then you're like, well, we talked about how we'll help you solve this. We talked about how this would align with your goals. We talked about how it fits into here. So tell me, like, what do you think it's not going to solve? Right? It's like more and just coming from, so you want them to say yes. So it's like psychological game that they come from for themselves. Yes, this is one of the problems. Or if they say no, then you're like, cool, tell me why no.

[00:37:11 - 00:37:56]
Right? And you're like, maybe I didn't explain that functionality correctly. Maybe I didn't understand what you cared about here. But you're having like a back and forth conversation, right? Your goal is to get yes, yes, yes, yes, yes. But like sometimes you'll get, no, I'm not sure. I don't think that actually is really what I was looking for. I was looking for something that did more of like this, right? You're like, oh, tell me about why you want that. Do you actually want that thing to solve it? Does getting this thing that you want actually solve the problem you have? Or can we solve the problem that you have in a different way? Right? Is it weird to get at least one yes? Is it weird? Is it weird to follow you? Oh, is it weird to get a yes? Yeah, yeah, yes. But we want to get more yeses, right? Because if they say no alongside that, if you're like, so do you want to get a surgeon

[00:37:56 - 00:38:43]
to work with us? And then they'll be like, well, these things are not good for me. So no, right? Maybe that one thing is enough. But they're like, yes, this part will solve most of our problems. We'd still like to move forward. But if you get a no, the point is you've discovered something that is not a fit, and you need to discover why. And you need to discover if it's actually a no, or if it's a no because they don't understand it, or because you're doing something a little bit differently with their features and functionality that might get them to the same results. it a certain way that you might need to reframe, right? And be like, well, do you need this thing? Or if you get this result, is that so good for you? Right? Or can you also tell me that the history call was not good enough?

[00:38:43 - 00:39:28]
Because I did not understand the person well. So that's why in the demo call, we can get a lot of notes. So can you tell me, oh, maybe I did the history call badly there? Or you ask the wrong things, right? like it's if you get to the demo call and they're like no that's not really fit that doesn't really solve my problem I wasn't really thinking that no like that

doesn't really it's not going to integrate with us that's not really what I wanted right and you're like hmm I asked bad questions or you changed from your last call to now of like actually what you wanted right All I need is the benefits, right? Because again, every time you talk about features, you want to align with something that they're getting.

[00:39:29 - 00:40:00]
Examples of how to do it and how you can talk about it, right? But I want to show you this because of this. Let me show you how the patient benefit data comes through for your team. It's clean, accurate data you can use immediately without your team spending hours on the phone to capture it, right? You want to talk about how you're going to solve the pain points and problems they have with the features and functional you have forever. forever and ever and ever. For the rest of your life, I hope you think of me in your head whenever you talk about a feature and you're like, oh my gosh, about why it's important in lifestyle. Right? I want you thinking, what is this benefit? How can I talk about this benefit? Because

00:40:00 - 00:50:00

[00:40:00 - 00:40:45]
it's not just the functionality. Yeah, forever. Okay, we're thinking about pricing, right? We're thinking about, before we get to pricing, right? We're thinking about objections that you should uncover that you should be thinking of before you get to pricing. We want to get to yeses, right? We want to get to like, yes, I can see this, yes, it makes sense, yes, this solves my problem, yes, I can see this in my team. But also you want to think about some of these you will want to uncover in your discovery. be uncovering as you're talking for your features and benefits of whether it like fits in their processes with their team right if it's not a priority right with them um if the ri is unclear if implementation feels like too much right which is why you don't show them how much work it is to set it up even if it's only a little bit of work right we don't show how hard it is to put up that's

[00:40:45 - 00:41:34]
for online that's for later um if adoption's uncertain if the workflow doesn't fit if they're like here's what we currently use i don't understand how we could fit this into our process to buy unless you solve that problem right and you want to uncover and figure that out before you get to pricing because they're like i don't see how this would fit and you're like this is what pricing looks like they're not gonna buy right um more stakeholders needing alignment right again back to our questions of authority like what is the process like internally who else needs to do this right for next steps for you if you know that it goes to someone else like for next steps so it sounds like it makes sense the ROI on your team is clear this is going to solve your problem from our conversation, our next steps are to get this person involved or to do this, or maybe we have a proposal call or strategy call to go through what that looks like together,

[00:41:34 - 00:42:19]
right? What are we going to make them look like together? Yeah? Okay. Pricing, right? We're reiterating value. We're doing the yeses and we're saying, okay, so it sounds like this is a good fit for this. Fits in your workload, fits in your team. You're excited about this. We're solving your problem, right? So here's what that looks like. To be able to do all of those things, right? We're talking about it. Simple, if you don't understand pricing, if you do pricing, you don't always have to have pricing in your demo, right? But some of you will, so I'm going to talk about it a little bit. Give them space to react, right? When you give them pricing. You don't want to be the first one to react when you say it. When you do this, right? Do you know what I mean by that? They're like, okay, this is $8,000 a month. So you don't want these things to go about $8,000 a month.

[00:42:20 - 00:43:06]
And then you leave. I feel a little uncomfortable. Because you're waiting, you're both smiling. I cannot wait forever. Right? I'm like, it's in here forever. I'm in here. It's like what it's love. Yeah. Like, just wait. Well, wait, right? Like, it's a million dollars a year. And then you wait. Right? I'm waiting for you to react. Because it doesn't matter what my reaction. It doesn't matter what the customer's is, right? And what they do. And you want to give them space to react. A lot of times, like, oh, there's no one that's thinking. And you're like, yes. And then you go back to your framing of what the value is, which is why it's important to know how much they're currently spending, right? What they're thinking about, how they try to solve the problem or other things they buy, so you can anchor it to things, right? That's what I'm thinking about when I say. Yeah, and what that looks like, right?

[00:43:06 - 00:44:14]
And so you can either back into a number, so you're anchoring to a number that they've already used, right? But you

want to give them space, right? And if they negotiated a lot of things before, they also might try to pay you off, right? You just go hang out. Right, so I'm going to respond to say something, right? And then when you're asking about what that looks like, it's like, oh, that's like a little bit expensive or more than we thought. And we're like, OK, what? Or can you tell me about how you're thinking about that? More expensive compared to what? It's more expensive than you were thinking, what were you comparing it to? More expensive to five in here. More expensive to two-tail people. More expensive than a competitor, right? Because you need to anchor to something, right? We're thinking about next steps. We are thinking about reconfirming the challenges they shared, how you can move forward, right? You can ask, right? Sometimes people are quiet on your demos and aren't very interactive, right? And aren't engaging as some other ones are, right? And you can ask if there's any blockers, right? If you don't ever get to know, right? Are there any reasons it would be challenging for you to move forward? Is there anything that will prevent you from moving forward based on what we said, right?

[00:44:14 - 00:45:00]
The same way I'm sure you guys have had interviews before where the candidate will be like, is there anything you like, with all my background that would prevent you from moving forward with me, from moving forward with me? You're doing the same thing, right? Because you want to identify anything that you can address on the call, right? Because you want to address, like, you should be like, oh, I'm not sure, like, I'm not sure it's the right time, I'm not sure this person will like it, right? And then you go back to, you said, like, this is a good fit, like, this makes sense, this did this. Usually when people say, like, they're not sure what's happening right now, there's something they're unsure about, right? Is there something that we talked about that I either didn't explain well, right? Is there something I didn't explain well? Something that we can go through again, something that I can tell you about because it sounded like from our conversation. You were excited about this. It would solve this problem. It would do this thing. And you had the internal company on.

[00:45:01 - 00:45:49]
So where can I help, right? And then reading from how it works, from what I understand, our next step would be to do this. I'd love to get you started with like our plan like how does that come to you right because we're moving forward with next next. Final double reminders focus on how your product helps them their value props and listen and don't just wait to talk and what I mean by that right sometimes when you have a conversation with people and you know they're hearing you but they're not listening to you they're just waiting to talk next and your customers can feel it when you're just waiting okay you're talking about you know okay i'm going to jump in and tell you about all my things right people can feel when you're not listening and you're just waiting to be the next one to talk don't do that right don't

[00:45:49 - 00:46:43]
be that person if you don't know if you're doing it maybe practice and try with a friend and tell them if they feel like you're engaging and connecting with them because your customers definitely can tell like i know someone's just waiting to talk and i immediately disengage because you're not listening to me you're just waiting to talk next to tell me about all other things Don't overwhelm them with complex pricing, or grand positions, and like, definitely if you're selling in the US, but also like just having a smile when you're talking to people, right? It's going to make people want to talk to you more, listen to your product, be charismatic, right? Talk to them, people like buying from people that they like, yeah? Okay, I have a couple examples. We'll just go through them really quickly of what a demo script would look like for a couple of companies. So Marvin is a customer insights platform that centralizes all customer data from CRM data, from product data, from interviews, from social media, from everyone in the place.

[00:46:44 - 00:47:32]
And so we're thinking about the demo, right, from Marvin, who puts customer data all in place for an analysis for sales, product, marketing teams. The problems are research is fragmented. since this is a slow, insights are not reusable across teams. Right? So insights that a marketing team has, the product team may not have, the customer success team might not have, the sales team doesn't have. Right? And so we're putting it all in one place. So we're showing, what are we showing first for this problem, for this discovery problem? We're showing a shared research repository with interviews, surveys, docs, feedback, because their pain is not needing more AI. Right? Their customers are not saying, we need to integrate AI. Their customers are saying, there's customer data everywhere, and all of our different teams can access it. That's the problem. Right? And so secondly, we're going to show an Ask AI website

[00:47:32 - 00:48:20]
and answers across the data set. Right? Because that's easy for product leaders, engineering leaders, design leaders to use it. Right? So here's how easy it is to find data across all of your data sets. Where before, you have to look

across CRM, across the product space, across marketing, across these different social channels. Now, right, you can just ask a question to see the data all in place. Analysis, work flows after because it helps the team faster with that headcount and then adoption path stakeholders and accepts right as just an example of what you can think about and you can reference them later for for how i would think about this right turning discovery into the demo here's things we learned here's the buyer ahead of ux research at the b2b staff company what we learned in discovery research is everywhere product teams have the same questions all the time insights are hard to share

[00:48:20 - 00:49:07]
team wants faster analysis but hiring more researchers. That's what I learned in discovery. What matters most? Centralizing the research from one place, speeding up analysis, and making insights easier to access across teams. So that's what I'm going to show. There's lots more functionality, lots more things you can do, but this is what they care about and what they want to solve. So that is what I'm showing them in the demo. Is sometimes good to show something more than just those main things? on something they bring up or talk about or something that you want to flag before showing it. Teams like you also care about, usually also care about this. Like is that something your team's thinking about? And so like, eh, they're like, okay, cool. Something I can show you later. Right. But then there's opportunity for outsell later. Right. If you're just

[00:49:07 - 00:49:53]
showing them more things, you're not making an easy buying task for them. Right. Because I have a problem. I want to solve it. There's potential for upgrade later. Right. But if maybe want this because other people want it you can ask about it but I wouldn't just be like and I want to show you this thing right um how it starts in the Marvin demo prioritize the number one workflow bottleneck first the welcome at first tying each particle into business outcomes so the flow right centralize some research showing the ask guy next the analysis sharing integrations and then adoption next steps right I'm thinking about Marvin and I have a script example for you what you can say or talk about just as an example we don't have to have more references for you for how I would do it for different people.

[00:49:53 - 00:49:59]
And this is my friend's company, so do you. Future to benefit, right? Here's the things we care about. Here's the

00:50:00 - 01:00:00

[00:50:00 - 00:50:50]
product moment, product things I want to show. Here's the feature, right? And here's the benefit, right? And then the question that you can ask, right? And I want you to think about the product, the benefit, and then the question that you would ask to understand the pain point or the problem so you can head back to the yes later, right? Does this make sense, how I structured it, how to think about it? You want to talk about that or should I go on to the next one? We didn't read the previous script. The previous slide. You don't have to read all of them now. But you can if you want. But I have them for you for reference when you're building yours up. Some of you already have demos and you have scripts and things that you're using already. I just have an example for you so you can reference later, so you can look at for how I would structure or how I would think about the script.

[00:50:50 - 00:51:38]
And how I would think about what to include. Because you can talk about it in a similar way, right? You can change it a little bit, but I want you to have an example, like a natural conversation of something that you would say for how we're like tying things together and the questions that I would ask. Yeah. But we can talk about it. Do you wanna talk about it now? Or everyone's getting a little antsy I think, probably because it's the last day of the week. I have one more example after this one. Yeah, okay. Ending it, we talked about three priorities today, reducing time when we looked at how Marvin can do these things anything we've seen today that would make the steps to roll out with this deal in line would next up be a deeper workflow review right because usually with Marvin it's not the decision maker on the first on the demo right

[00:51:40 - 00:52:30]
it's someone from the team who's excited about bringing the data together and the next step is breaking someone else on and doing the second one um okay here's Sparrow Sparrow has lead management software so like maternity, paternal leave, workers comp, any of those leave situations. Sparrow isn't the startup that you can come? What? Is the startup in the bench? There is a startup in the bench in Sparrow. This is a different one. Also one of my friends. So it's a leave management software, right, and it cleared customized leave plans and taken paperwork. Sparrow, the

other one is environmental data tracking. and has a global lead dashboard but the automating of the federal state and local lead filings is like a majority of what they do. So we're thinking about what this looks like,

[00:52:30 - 00:53:18]
right, what lead looks like, lead management is manual, compliance is really stressful, and payroll coordination is really messy, right, that's what we found out in discovery, what are we showing first, what are we thinking about, we're showing a structured lead workflow flow from intake through these 10 because that's what's complicated. It's really complicated. There's a ton of paperwork, a ton of things you have to file at different times. It's very, very messy, right? Showing second, compliance paperwork and notifications automation, right? So you know what to do when for every employee that you have. And third is like payroll coordination, state code of visibility, right? To make the process easier to match. So when we're thinking about this, our discovery, right? We're thinking about our buyer. People are head of HR. What did we learn? administration is manual, team worries about compliance, employees have a confusing lead

[00:53:18 - 00:54:05]
experience, and HR usually doesn't want to add more people because it's just an overhead expense. So when we're thinking about what that looks like, we're looking at, here's our recap from our last conversation. It sounds like your team is spending too much time managing lead, coordinating, keeping up the state requirements. You mentioned the employee experience can feel confusing and inconsistent, and that's all out there. We're reconfirming the things If we could improve one thing first today, right, because maybe you're like, I'm not sure which one you care about, I don't know which thing to show you first that would be most exciting. If we could improve one thing today, because there are a lot of things we talked about you wanted to solve. Would it be reducing admin time for HR, lowering compliance risk, or making the lead experience sooner for employees, right? Because you're like, which one should I show you first?

[00:54:05 - 00:55:11]
I don't know, because we didn't prioritize them in discovery, and I don't know which one you care about most. But you should show them the one they care about most, right? They'll tell you, I care about this, then this, then this. Yeah? And then I'll show you how lead gets managed from intake through planning because that's where a lot of manual work and confusion usually begins. And I know I can wow you because there's so much stuff you have to do. And when I show you the beautiful way that it's organized with you just setting one thing up instead of doing all this documentation and setting out people, people love it. Right? So that's what I'm going to show you first. And then I'll show you how the compliance steps, paperwork, and notifications can be handled in a more structured way. Right? about. I don't care about all the other functionality you have. I don't care about all the other things you do. I don't care about how I set it up, right? I care about making the experience seamless. I care about it making it easy for employees. I care about it being easy for HR so we stay in compliance all the time, right? Okay, and then feature to benefit, right? Again, here's features. Here's the benefit, right? Let's say for the first one, like leave intake and planning. How much time is your team currently spent just gathering the right information and exploring options before the leave even happens?

[00:55:11 - 00:55:57]
right how much time does it take does it take them an hour does it take them a week right how much time that you're like oh it takes a week let me show you how you can do it in 30 seconds right we've got all the documentation together right um when do you ask this question you show it and then immediately jump to the question yeah and you come yeah or you can ask the beginning right it depends on like your flow and how you want to do things right i'm showing you a flow of like how i would do it for each of them but if you feel more comfortable asking in a you can right don't say everything's in a way that feel awkward or comfortable for you but say them in a way that like feels natural to you because it'll come across better right and part of it is just practice right there's i have a lot of examples here because when people actually go

[00:55:57 - 00:56:37]
and start doing it and start practicing and trying to do things it feels more uncomfortable it's hard to remember transitions it's hard to remember the things that you want to say it's hard to control the conversation it's one thing to listen to be like yeah yeah i know how to do demos and it's another when you have to go to do it and you have a customer and you're like what are the things i want to tell them i want to show them right and so for your first ones i would write out and have some scripts or for a couple of like here are the things for this icp for these pain points they're solving here are the data points that i want to make sure to hit and remind them of here's the things that i want

to say here's how i'm going to structure it here's how i'm going to show it to them right so you have your order what's the benchmark from uh what's the benchmark in general

[00:56:44 - 00:57:30]
I think it's from proposal to close. No, no, no, from F&M to proposal. Ah, that was a proposal. I think it was 45%. 45. From qualified? Across all industries. Okay. Yeah. And for more of the mid-market enterprise, is it like lower or lower? I can't tell you, but I can go look at my presentation. But we will talk about it, about each of the stages and backing into the numbers and what you should do. Ending it in a similar way. For the sparrow thing, right, which is just next steps. And again, it's mostly practice.

[00:57:31 - 00:58:19]
The same way with the discovery call. It's one thing to know what you should say, and one thing to feel like you can do it, and it's another thing to actually do it. thinking about what you want to get across to your customer, what you want to show them, what value you're going to tell them, and practice the transition and practice things that feel uncomfortable. Like moving to pricing, right? Like doing the agenda at the beginning, right? And owning the conversation. Like getting to the moment of excitement and feeling like, great, I showed you something really cool that you said is a problem that I can show you how easy it is to do, right? Whatever part in the demo that you are not comfortable with or feel like you haven't practiced enough, that's where you should practice yeah um and practice for tomorrow so when we're thinking about designing our demo right here's this one back to our um our canva um of things that we

[00:58:19 - 00:59:08]
want to um map out you don't have to do this right this is just for you for reference what you have to do is do part of your demo tomorrow right if it's helpful for you use it if it's not helpful for you don't consider. Yeah? Your outline. So today I want you to think about what your demo outline is for one ICP. For tomorrow, I will be your ICP. You'll have to tell everyone what your ICP is, who it is, and what part of the demo you want to do, right? Because we don't have a ton of time tomorrow, I want to be clear that I do not think your demo should be 10 minutes in general. We had one startup, another batch that was like, it should only be 10 minutes i cannot do it 10 minutes no just for tomorrow pick a 10 minute segment of your demo right that you want to show i will be your customer tell me who i will be tomorrow and we're going to

[00:59:08 - 00:59:56]
go through and i want you to practice right this is not the same as product demos where you were like showing everyone how it works this is like practice for you for what part of the demo that you want to get feedback on from the team that you want to practice with that is maybe not something you normally do maybe you want to practice with a specific icp with an enterprise um it doesn't to practice and do tomorrow right that's what we'll do but i think the demos are super important these interactions and how you handle the different uh interactions with customers are super important which is why i want to do it right same with the discovery calls um and if you want to do a full one later in office hours you want to go through it and have them practice being a customer because it is like it's one thing to understand the theory of how to do it and it's another to be able to react with customers and walk through each other things and the best person to

[00:59:56 - 01:00:00]
practice with is anyone who is not your customer first, right? For

01:00:00 - 01:10:00

[01:00:00 - 01:00:44]
the person to do it. Yeah. Yeah? OK. Great. OK. So now you can work on it. If you want any feedback, right? We have about an hour. So you can start mapping out. If you want feedback on it, if you want to test and try something, happy to do it over the next hour. If not, then what is it, 10 AM tomorrow? I think I'll pick an order, or we'll get volunteers, and then we'll go through that. Yes? What can you write? Sure. I don't know if they don't find us. Yes. Yeah. Have an outline. I mean, technically by tomorrow, right at 10 AM, you should have some outline, and you should have an idea of what 10 minute segment you want to do. Pick the part you want to practice, because you're not going to be able to do your full double in 10 minutes, right? So you can start over.

[01:00:45 - 01:01:09]
If you want to start a pricing, if you want to start some more excitement, if you want to start to practice at the

beginning, you want to talk about the agenda, summarizing, prioritizing, that's fine too. I mostly want you to practice something you either don't do, or you don't feel fully comfortable yet. Yeah? Yeah. Does that make sense? Yeah. Okay, one hour and I can give you feedback or you are free to do whatever and be ready to end up tomorrow. Okay. Yeah? Okay, here. Great.

[01:01:35 - 01:01:39]
Oh, he's sitting outside. You guys want to stay in this room? I mean, you can't stay in this room? But yeah.

[01:01:57 - 01:02:00]
Thank you.

[01:02:33 - 01:03:00]
Okay. Okay. I think it has to, so, you know, the part is, oh, no, and we know the way you do the things. Okay, can you show me a good demo? You're good. Uh-huh, we're all in. Okay, yeah, okay. Okay, good. Okay, good. Okay, good. Okay, good. Okay, good. I don't know.

[01:03:29 - 01:03:39]
I don't think she's happy enough. But try as well. It's all that to you. As long as I can. Okay, we're in.

[01:04:09 - 01:04:48]
Yeah, I feel like I have a little better. Yeah. Yeah. I do. I do. Where are you going? I don't know. What? You want to go ahead? Yeah. I'm going to go forward. I'm going to go forward. I'm going to go. I'm going to go. Since . . . .

[01:05:52 - 01:05:54]
Thank you.

[01:06:11 - 01:06:12]
All right.

[01:07:07 - 01:07:09]
Thank you.

[01:07:18 - 01:07:21]
Thank you.

[01:07:49 - 01:07:51]
Thank you.

[01:08:15 - 01:08:16]
Thank you.

[01:08:45 - 01:08:47]
Thank you.

[01:09:51 - 01:09:55]
Oh Thank you.

01:10:00 - 01:20:00

[01:10:09 - 01:10:12]
Thank you.

[01:11:21 - 01:11:24]
All right.

[01:11:37 - 01:11:37]
All right.

[01:12:12 - 01:12:14]
Thank you.

[01:12:57 - 01:13:03]
I'm going to go.

[01:13:14 - 01:13:15]
Thank you.

[01:14:23 - 01:14:26]
Thank you.

[01:14:41 - 01:14:44]
Thank you.

[01:15:13 - 01:15:16]
Thank you.

[01:15:43 - 01:15:46]
Thank you.

[01:16:17 - 01:16:20]
Thank you.

[01:16:47 - 01:16:50]
Thank you.

[01:17:07 - 01:17:08]
Yeah.

[01:17:46 - 01:17:49]
Thank you.

[01:18:15 - 01:18:18]
Thank you.

[01:18:48 - 01:18:51]
Thank you.

[01:19:17 - 01:19:19]
Thank you.

[01:19:43 - 01:19:44]
Thank you.

01:20:00 - 01:30:00

[01:20:35 - 01:20:37]
Thank you.

[01:21:17 - 01:21:20]
Thank you.

[01:21:31 - 01:21:34]
Thank you.

[01:24:35 - 01:24:38]
Thank you.

[01:24:56 - 01:24:59]
Thank you.

[01:25:16 - 01:25:19]
Thank you.

[01:25:44 - 01:25:47]
Thank you.

[01:26:40 - 01:26:42]
Thank you.

[01:27:17 - 01:27:20]
Thank you.

[01:27:51 - 01:27:53]
Thank you.

[01:28:11 - 01:28:14]
Thank you.

[01:28:43 - 01:28:46]
Thank you.

[01:29:12 - 01:29:14]
Thank you.

[01:29:43 - 01:29:45]
Thank you.

01:30:00 - 01:30:32

[01:30:05 - 01:30:06]
Thank you.

[01:30:31 - 01:30:32]
Oh yeah.
