Session 1: Building a Product that Leads Growth - 01:20:36

GMT20261006-120340_Recording.m4a

Sections needing extra caution

Automatic speech recognition can mishear product names, accents, questions and numbers. Speaker identities are not assigned in the transcript. Check the original recording before quoting exact wording. Examples from the lecture are not verified MediMind results.

Session 1: Building a Product that Leads Growth

Source: GMT20261006-120340_Recording.m4a

Recording duration: 01:20:36. Times below are local to this recording.

00:00:00 - 00:10:00

[00:00:00 - 00:00:51]
Julia has a good background, by the way. I was just trying to ask him that. I'm like, did you go back to Tbilisi? Like another boot camp. That's good. Let me see. Okay. Tell me if you see my screen now. It's still loading. Yeah, we can see it now. feel free to start. Okay. You still see everything well because I have a timer. You don't see the timer, correct? No, we can't see it. Sometimes it works. That's great. Okay, we can start. Yeah. Great. Okay. Glad to see you. Today we're covering product-led growth fundamentals. Okay.

[00:00:53 - 00:01:38]
I'll introduce myself very quickly. I'm Giacomo. I've always been a first-door founding product two of them are now series B, one of them is still Bootstrap. The reason why I started my journey in tech is that I wanted to learn how to help people express themselves through entrepreneurship because, I mean, we're in an era which is a beautiful time to be alive because you don't have to fit a job place that already existed before you were born. You can basically invent something of your own. And so I'm very happy to help you in this. And that's what I'm doing mostly since 2022, acceleration programs. And I'm a venture builder and fractional CPO since then. But you don't care much.

[00:01:38 - 00:02:25]
So blah, blah, blah. Let's talk about product and growth. And this is what we're covering today. We're trying to understand how to iterate the right way. So one of the most common questions that I get from founders at your stage is how do I prioritize the feedback that I'm getting or some variation or flavor of this? We'll try to learn how to build the right product, how to use your product as a base for growth, as something that generates additional... Through its usage, it generates additional opportunities for customer acquisition. And we'll try to take a look at growth loops as a first way. Important, two things. First of all, feel free to interrupt me whenever, okay? Right in chat, unmute. You don't have... So you can unmute and just talk over me and ask a question.

[00:02:25 - 00:03:11]
That's not a problem. writing chat, but I don't see everything immediately because I have multiple things on my screen going on, of course. But I will make sure that I don't miss any of your questions. But feel free to interrupt again and ask or challenge. I will be doing some examples. Some of the things will be very relevant for your startup where you are right now. Some of them will be relevant for the future. So if some of these activities is relevant for the future, feel free to like keep it in your drawer for later on. Okay. Because the time will arrive soon. I will walk through some examples and I will walk you through some exercises that we are not doing during the session.

[00:03:11 - 00:03:58]
Okay. Because we don't have time. But I will share some templates and stuff to be done. An important thing for clarity. You don't have to, I will give you a worksheet, which is basically a template that is, it's something like a guided brainstorming for you to help you with the things that we're covering today. You don't have to fill it for the office hour. This is not homework. Okay. This is not something that I expect that you are doing. If you feel like it's important for you to do this activity right now, do it. If you want to discuss it during office hours, hours but during office hours use the time that we will have together for office hours in the best way as possible okay we have 45 minutes of office hours

[00:03:58 - 00:04:44]
if you i mean i don't want to spend this the 45 minutes uh uh reviewing homework okay so that's not homework if this is something that helps you come to the office hour with an agenda and clear questions and stuff like this that's great but in general come to office out to the office hour with the most important things that you want to discuss to make the best usage of the time that we have together. Okay? Ready to go. Let's start from here. So I'll tell you about the first product that I managed as a product co-founder. The name of the product was Shippy Pro. And back in early 2017, when I started working at it,

[00:04:44 - 00:05:29]
it was an MVP. and it was a software that allowed users to create shipping labels. Okay, so how did it work? Mostly, our clients were users, people who had a package to ship and instead of going through the various courier sites and understand which was the best option, they could come to our website, input the package information, pickup point, etc., create a shipment and label through our site will come at the scheduled time to their home to pick up the package, okay? So we were trying to iterate on the MVP. And when iterating on our MVP, I started asking for customer feedback, no?

[00:05:29 - 00:06:13]
And the kind of question that I was asking was something like, okay, what can I do to, what can I add to this product to make it better for you? How can we improve the product? What if you had a magic wand? How would you do this product better? How would you make this product better for you? questions and we got very different replies but we got a specific reply that caught our eye which was one of our customers had a small shop and in this small shop he was using our software to offer shipments shipment services to their clients okay one of the many services he was it was offering was a shipment service so he asked us to build a feature which was the invoice creator so basically

[00:06:14 - 00:07:07]
shipping a shipment through our system he wanted us to also create an invoice with a markup for their client so he didn't he didn't have to separately create the invoice for the client it was done all in the same process and he thought that okay if you do this for me if you make a feature that creates the invoices directly i will i offer you one year worth of payments in advance okay and so i want to ask you if someone came to you today offering this one year of subscription one year of usage prepaid etc etc but you i want you to make a feature for me would you take it or turn it down be honest dimitri or in chat yeah it depends if someone else needs the same feature if it's only for

[00:07:10 - 00:07:56]
At that specific time, it was just from this request. Okay, we asked them, what do you want us to make? And this specific client said, I want this invoice creator. Nobody else asked for that. I mean, I would say maybe depending on how much it costs to make that feature, right? Because if it's like not too costly, then it kind of probably makes sense. so I would just say also it's context dependent from kind of this open ended question to me specifically it was more or less a couple of weeks of work for one of our for our development because we just had one, the CTO how much this feature would be aligned with other similar ICPs

[00:07:56 - 00:08:42]
with other similar customers back at the time we had no idea we had very low still still our usage and then we were still not so sure about who was using our product we saw usage there was revenue and stuff like this but still we hadn't a very clear idea but this is a very who who else is a very cool question by the way so in our case we we we had a situation like like this we didn't we didn't know how to let's say it was a completely different type of a client and we did it we did a lot of custom things because we thought that would be reusable

[00:08:42 - 00:09:28]
in the future eventually we were lucky some most of them they were but we gave up a lot a lot of time developing it i did the same thing so i took the offer and i took another one similar one and And I started basically, my job at the time, I didn't know how to manage a product. I had no idea. I wasn't, I mean, I was learning, okay? And so learning by doing, because when you co-found a startup and you are 22, 23, that's what you're doing. And so I started asking, what do you want? And receiving orders as if I was something like, I don't know, a waiter or something like this. and I got at the end, after a few months of doing like this,

[00:09:28 - 00:09:59]
I got something like this, okay? A giant pizza with sprinkles, popcorn, Smarties, tomato, olives, cheese, and a full chicken on top of it. What do I want to say? I want to say that nobody else used that feature. That specific feature didn't drive any additional customers and you might say, okay, so what's the problem? I mean, they paid it for you. They paid it. So, the amount of money they gave us was basically, was covering the cost of our developer for two weeks. The problem

00:10:00 - 00:20:00

[00:10:00 - 00:10:46]
is that that feature stayed there creating code dependencies and confusion for new users within the product. Some new users were working in, they saw the invoice creator, they had no idea what it was for, they tried playing with it, some of them got confused and thought, okay, maybe this product is not for me until we decided to hide this feature for all the others except for the one that asked us. which means that we basically realized a few things. First of all, we had been doing a very bad deal. So we were doing an agency work priced as a software as a service, okay? So if they want you to make custom things, sometimes you need the cash flow, sometimes it's profitable, that's not enough.

[00:10:46 - 00:11:34]
You want custom things, have custom prices, okay? This is not a feature. This is a customization. That's a different thing. And so sometimes you are forced to do agency work. Sometimes you decide you want to accept to make heavy customizations. That's okay. I mean, sometimes you have to take it. Make sure that this is not priced as a software, as a service, because otherwise you're doing a very bad deal, because the same kind of things are paid a lot more usually. We basically realized that we were building something like a Frankenstein product. something, but not a single thing very well. Okay. And so we realized that basically we were lacking a good way to ask for

[00:11:34 - 00:12:21]
feedback, first of all, and to prioritize this feedback. And lacking this was directing us towards creating a product that wasn't doing anything well. We were basically a bunch of nice to haves. but you know I usually say that that so doing many nice things is not as good as doing one thing very well I make an example which is if you want to offer a great dinner you can have a great main course then you can have side dishes and stuff like this but if the main course is very good dinner is good but if you have many side dishes that people barely can taste and stuff like this, that's not a good dinner. And so it's important that you have a strong core, you have a

[00:12:21 - 00:13:11]
strong wedge to break into the market because you need to have one thing where you are a lot better than all the alternatives, not just the direct competitors, all the alternative ways of solving the problem. At least one in which you are a lot better, not slightly better, a lot better. Having one in which you are a lot better is a lot better than being goodish in 10 things. And so, and that's where I learned the hard way that not all feedback are created equal. Okay. And so, as I said before, one of the questions that I get most, most asked from by founders is, okay, I launched my MVP or launched my product and I got many feedback. How can I prioritize the feedback that I receive? And so based on my experience, I came up with something like a framework. Okay. Um, that I will show you, which is done with the main steps are these ones. First

[00:13:14 - 00:14:05]
Not all feedback are created equal. So Nikos was saying something interesting, which is who this come from? Is this somebody who's aligned with the rest of your ICP, etc., etc.? Is this a problem that we have commonly find in your user base, etc.? So you don't want to take... Everybody will give you feedback because feedback is free. Feedback costs zero. But you don't want to take feedback from anyone. anyone, but not all feedback are equal. So you want to listen to the people that are the right people to ask feedback to, the ones who really feel the problem that you're trying to solve. Okay. Once you have segmented the feedback based on who it comes from, it's time to understand what value you are creating for them. And then it's time to understand how to iterate so that

[00:14:05 - 00:14:51]
you are creating more value for them. Okay. We'll cover each one of these steps. let's go into the segmenting what you are looking for you're looking for the so-called lighthouse users who are the lighthouse users they are the ones who are feeling the pain and are looking for a solution and they're called this way because they usually make light to your way with good feedback so if you're talking with some of your users that start asking for the dark mode or something like this this is probably not a lighthouse user at this stage okay you want what you're building. So the main question that you're asking right now yourself is, okay, who finds this really valuable or important? Who finds this problem really urgent to be solved? How to

[00:14:51 - 00:15:39]
find it? You want to look for mainly for behaviors. Okay. You want to see behaviors that I like, that they have this pain and they care about this. Where can you look? You can look in your product data, people who show certain behavior. I will make you an example later. Or if you don't have enough product data yet, you can look around. For example,

Reddit communities and stuff like this, people who tried a solution for that specific problem or are creating a solution with vibe coding or whatever. Okay, they feel the problem. That's pretty evident. Their feedback is important. You are building for them. These are the kind of people you're building for. So how do you segment? a behavior metric and you want to, we're not looking at the average. Average doesn't say

[00:15:39 - 00:16:26]
anything. Okay. You want to say the exception, you're building for the exception. People who care a lot. And in this phase, people who care a lot are a small niche, but if you build a great product for them, you will pave the road to get to more people like this. So I usually take a behavior metric and I take the top 10 or 20% of users showing segmented based on that behavior metric. For example, if in your product engagement is very important, you can take segment the top 20% most engaged users. Or if it is, I don't know, another kind of action they're doing. Okay. Select the behavior and segment. And this is your most important. So these are the ones that are using

[00:16:26 - 00:17:14]
your product most, the one that you want to listen to, their feedback is not the same as the average person's feedback. Okay. They care about it. They're doing something with that. You want to understand, you want to learn. I don't know how many customers or users you have right now, but I would say, I have to say something. The top 20 customers that you have, the top 20 users that you have, you have to know them one by one. You need to know perfectly who they are, what are they using it for, the use case and everything. specific peculiarities, et cetera. The first product that I was, we know all of them one by one. They were sending us gifts for Christmas. We were calling them. We were giving them proactive assistance. We were informing them before releasing new features. We were asking them, interviewing them for new features.

[00:17:14 - 00:17:59]
These are your early adopters, your top 10% user, top 20% user. You need to know them one by one. You need to know who they are perfectly, okay? Okay, so first of all, to segment, you want to take the top slice based on usage, on behavior. Okay. Some AI tools that you can use, Mixpanel AI or Amplitude AI for product data, your LLM will prompt if you're looking for communities in which people are looking for a solution related to your problem, or they are showing, showcasing some kind of solution that they created. After you understood who cares about your product a lot, it's time to understand why they care about your product.

[00:18:00 - 00:18:44]
What value we are creating. There are two sides of this coin. Two faces of this coin. One is the value that we are creating. What is the core value? What is the main single reason why what we are building is important for you? What value are we creating for you? And there is another phase, which is another side, which is what are the value blockers? Value blockers are things that prevent user forgetting the value or forgetting more value. Okay. Stupid example of value blocker. I love your software, but it doesn't work from mobile. So until you make a mobile version, I do this operation while I'm on the go. I don't have a laptop with me. I love your product. I cannot use it for most of the time. That's a classic value blocker. Okay.

[00:18:45 - 00:19:33]
Where do we look into? data. Okay. So you take your top segment and you analyze their usage. Which actions is your segment performing more than the rest? They are an exception. They are an outlier. You are building for that outlier. And so you want to understand which action your segment is performing more and what value this action could represent. Okay. You see that these top users are using that specific feature or in that specific way, a lot more in a strange way. Okay, this tells you something about the reason why they're there. You can also use, I would recommend you to complement quantitative data with qualitative data. If you don't have quantitative data, use qualitative.

[00:19:33 - 00:20:00]
There is a huge missing here, qualitative interviews to users in the segment. But also if you have quantitative data, think of complementing them with qualitative interviews. How to do it? this is the kind of question that I was asking, okay? Which feature will make this product better for you? What would make this product better? If you had a magic wand, what would you do to this product to make it better for you? Blah, blah, blah, blah, blah. What's wrong with that kind

00:20:00 - 00:30:00

[00:20:00 - 00:20:48]
of question you have an idea because we're not asking about specific outcomes like what is the specific outcome this tool needs to make for you it's correct we are basically uh we're basically asking them not about what they want to achieve which they know we're asking them to come up with a solution the fact is that I'll tell you with a metaphor, let's say that, uh, I don't know, I have a pain in my elbow and I go to the doctor and I say, doctor, I have a pain in my elbow. And the doctor say, okay, what kind of medicament would make this better for you? What would you do? You run away from the doctor because, and if the doctor starts saying, okay, we thought of a bandage,

[00:20:48 - 00:21:39]
we thought of a pill, uh, for the pain, or we thought of, uh, I don't know, physical therapy, I run away because you are the doctor I'm the patient I know I know about my pain I know about the outcome I want I um I would like to achieve but I don't know about the solutions solution is in your field so make sure you wouldn't go you wouldn't go to that doctor okay so don't be that doctor you want to be a good doctor for your patient which means you run qualitative interviews to them and you look at data because you want to understand what are their pain and what are the outcome they want to achieve but coming up with a diagnosis and with a therapy is up to you which

[00:21:39 - 00:22:25]
means out of our metaphor they know about the problem they know about their outcome but the solution this is in your field you're expert of the solution they're expert of the problem and the outcome that they want to achieve so you're listening to them um you're listening to them They tell you what to build. Okay. There's a very famous quote by Henry Ford saying, if I had asked what they wanted, they would have said faster horses. Okay. Faster horses and they come up with the car. Of course, I mean, that's your job. You study technology, you're into this, you're deep diving into AI or whatever else in order to serve them. They're expert about something else. So it's very important that you go very deep

[00:22:25 - 00:23:12]
into the space of solution. So I would recommend if you go there out there and you ask things like, which feature do you want? What if you had a magic wand? How can we make this product better for you? They stop treating you like a doctor. They start treating you like a waiter. And they say, please take me this feature and take me this feature. And you know, the worst thing is that sometimes you develop the feature they asked in the way they wanted and they're still not using it because they didn't know that they didn't need that. because the realm of solution is up to you. So some better questions to be asked during qualitative interviews. Be a good doctor, okay? Very minimal script for interviews. First question could be something like, hey, can you tell me how you decided to try this product?

[00:23:12 - 00:24:01]
It could be used on your product or on a competitor product. That's cool because you can use it for the same pain but another solution. How were you solving this before? What were you doing before? What made you think that there was a better way and made you look for a better alternative? And this is very useful to unveil the value that you're creating, okay? Because in this way, you understand how they were doing things before, how the new way compares to the old way they were doing, and so what's the outcome they were looking for, and how they measure your product product in terms of value versus the previous alternative, okay? What's the value in their own words, in their own definition? And then there is another interesting question that you can ask, which is, okay, you told me that you're using this product, which again could be your product

[00:24:01 - 00:24:49]
or another product. Is there part of this that you're still doing as you were doing before or with another product and why? And you might find out that there are some situations and contexts in which you are not, the specific product that you're inspected or your product is not the top pick. Okay? Take the example of before. Yeah, I like you. I use it a lot. But when I'm on the go, I still do it the whole way because your website is not optimized for mobile. As simple as that. And that's a value blocker. Okay? So you want to learn of situations and contexts in which they switch to their previous way of doing stuff because this is a value blocker. Okay? Some AI tools to look for this. prepare a minimum viable script for interviews. It could be, again, five minutes, 10 minutes

[00:24:49 - 00:25:37]
interviews. It doesn't have to take forever. It can be sometimes you don't even have to schedule a call. You just call them and ask a few things and check in on your users. And most of them will appreciate. Again, we maybe had very

kind people, but they sent us gifts for Christmas food because usually in Italy we send food for Christmas. Okay. They sent us food for Christmas to the address and I recommend using Granola or Fathom for transcription and analysis which is very good Fathom has a nice feature which is the highlight feature which allows you to say hey these things that that this thing that this person is saying right now is very important because there is something that Granola and Fathom don't capture which is the tone and intensity with which some

[00:25:37 - 00:26:27]
people say something okay if I say yeah I'm interested into this no I'm interested into that thing. So you want to highlight, okay, that's something important. You want to make sure that things don't get all plain into the transcript and important spikes in emotion and stuff like this don't get lost. Okay. I'll give you an example of how to segment and capture based on the product that I was talking about, the shipping software. Okay. Okay. This was our hypothesis. is cool okay the segmenting part we thought that we were uh building mainly our our icp initial icp were mainly small shops shipping souvenirs to tourists as you have seen before i'm from florence there are a lot of tourists they they buy statues they buy leather goods and stuff like this some

[00:26:27 - 00:27:15]
of them they don't have space in their luggage they want to ship them directly to their home address and so many shops are offering this kind of service we were helping these shops offering this kind of service or in general small shops we want to offer package shipment services okay the core value that we thought we were creating was saving because through our system they could compare different uh carrier prices and they can could use our contract with under our contract all the shipments of all the shops, which meant that we could get better rates and negotiate better rates than what they were getting. So our rate, including our markup that we were keeping for ourselves, was better than

[00:27:15 - 00:28:09]
whatever they could find out there on their own. And so for us, the core value was that we were offering them the lowest price as possible. Value blockers, based on feature requests, again, the only data point we had was like, okay, what do you want us to build? Shipment and markup invoicing and another thing which was related to customs documentation. These were the main two requests. Again, we did it. Nothing changed. Nobody used them. Only 1% of shipments needed the documentation for customs and most of carriers already handled this part. So nothing changed the game. So our scenario was not very actionable. Why? Because what was the only way to increase the core value that we were creating? It was to lower prices, basically. But we couldn't lower prices because the only way for us

[00:28:09 - 00:28:56]
to get lower prices was to operate at loss or to try to get higher quantities. But in order to get higher quantities, we had to operate at loss basically. And so it wasn't so actionable for us until we started doing what I was telling before. So we started segmenting, we started analyzing the usage data and we started to talk with these people, not asking them what feature do you want, but try to understand very well the segment that is using this product very much. What are they finding it very useful. And we had a very different scenario. We started from the who again. So we discovered that our top 20% of users, which were for us 20% of users that are shipping

[00:28:56 - 00:29:41]
most packages, okay, we were not interested in engagement or not for us, our metric was, we were monetizing based on how many shipments they were shipping. And so we were segmenting based on who was shipping more through our service. Okay. So our 20% of biggest users were mostly small e-commerce founders. And so we thought, okay, maybe the ICP that we built this for is not the real game changer here. So there is another ICP who is using this for a lot of more reasons and a lot more. and we discovered based on the usage data that these people were using a small feature that we have

[00:29:41 - 00:29:59]
which was CSV import and they were using it a lot more than the other shops average user was basically almost not using it it was a very simple thing you could type the things or upload the CSV most people were typing things these people were

00:30:00 - 00:40:00

[00:30:00 - 00:30:47]
uploading CSV. Why? They told us that this was fast tracking the process of shipping orders from e-commerce platforms. So they were saying, okay, when I receive orders on eBay or Amazon, I download the CSV, I upload the CSV on your website, and I create the shipments in bulk, and that's done. And so we discovered that they were not there for saving money. They were there for saving time, basically. core value and when I asked them okay is there something that you still do as you were doing before which was copy and paste on the courier website some of them say yeah some of them were saying like I'm still shipping manually 70% of my orders which means that basically I'm filtering

[00:30:47 - 00:31:35]
out of the CSV a lot of records because they told us you know for example for the Italian islands good rates, but for the mainline Italy, we have a lot better rates with our own carrier contract. And so we are shipping more than how you are shipping on aggregate. And so we're getting better. Some e-commerce companies were getting better deals than us. And so some of them were like, I would love to use your system for everything because it saves me a lot of time, but for some packages, it costs me too much. And so I have to revert to the manual copy pasting. Okay. Okay, now there was something actionable to act on. Okay. And we were like, okay, we have some, there is leeway for doing stuff and experimenting

[00:31:35 - 00:32:19]
stuff. If you want, you can do something similar too. I'll copy paste here this link in the chat. This could, this would give you access to a copy of a workbook in which you, the activities that I will show you today are done. have time to do this, just confirm me that you are able to create a copy and your own copy. I don't see it. So it's your copy. It's not shared with me. You can do whatever you want. Do whatever you want. It's for you. Okay. Please give me, confirm me that you're able to open it. Just a thumbs up or something like this. I was able to copy myself. That's great. Okay. It means that it works.

[00:32:20 - 00:33:06]
Again, for clarity, take a look at it. If you think that it's the right moment for your startup to do something like this, start doing these activities. I'm not expecting to discuss this into our office hour. If something that you come up with, it's important for you and you want to discuss in our office hour, that's great. But I'm not checking it in the office hour. Okay. It's for you, not for me. Okay. It's meant for you. Okay. So what's the idea? Later on, if you want, you can segment your product data and try to understand who really cares about what you're building based on the usage data, what they are doing in your platform, so why they are so interested, which actions, which things they talk about, what are

[00:33:06 - 00:33:52]
the value that they're finding in your product? Try to use a word or a very short sentence, followed by a short explanation, but try to keep it as summarized as possible. And this is like your product non-star, okay? It's like, okay, this is the value that we're creating. We want to create more and more of that. We want to remove all the obstacles for people so that they get that. Because that value, if that value is the metric through which they're measuring if you're good for them or not, you want to be insanely good in giving them more and more of that value, okay? and same for the value blockers following more or less the example that you've seen in the slides. Of course, you will need heavy customization

[00:33:52 - 00:34:39]
for your own case, but the main principles are this one. There are some people that care a lot about what you're doing. You want to understand who they are, why they care about that a lot and why some of them, even if they are very similar to the ones that are using it a lot, why some of them are not able to get this value. What are the value blockers? and you want to work on them. Once you have found all of this, so who you are important to and what is the value that you're creating for them, it's time to iterate, which is basically when you start to craft product initiatives that either double down on the whole value or unblock the value creation, okay? Or consider people think if you notice that there is another very good direction

[00:34:39 - 00:35:24]
you're not aiming for. Let's go through them one by one. Ideally, at this stage, 80% of your product roadmap should be about doubling down on the core value. So after you found what they want, give them more of what they want, okay?

As much as possible. And so my suggestion is to strongly prioritize creating more of your core value. Okay. Are there some new features I can add to give them more value? Or what can I iterate and improve in my existing features and flow to give them even more value? Okay. If it's time, I can help them save even more time. If it's something else, how can I help them with this even more?

[00:35:24 - 00:36:11]
Whatever it is that they are measuring you against. Okay. I want to become a lot better in that specific. 20% of your, roughly 20% of your roadmap should be about value blockers. Okay. So help your users unlock more value by removing the obstacles that like don't allow them to enjoy the benefit and the value that you're creating. 80 to 90 is a very strong imbalance, I realize. And the reason why it's a very strong imbalance is that your main thing is the core value. Your obsession should be about giving them more of that. Then there are value blockers, of course, you want to remove them, but most of them

[00:36:11 - 00:37:04]
would be about this. And then there is another thing, which is pivot. I think it's important to clarify what this term really means. So iterations are evolutionary, okay? You discover something and you iterate in an evolutionary way. Pivots are revolutionary. Okay. How does it usually works? Founders don't find traction. They get frustrated and they decide to pivot and pivot and pivot in the hopes that something will accidentally work. Okay. First of all, resist that temptation because it doesn't work like this. It's not a random process. Okay. It's a structural process. It's a discovery process. And second, this is not a pivot. So if nothing works and you want to try something else, that's how we screwed up.

[00:37:04 - 00:37:51]
It's okay. Sometimes we screw up. That's not a pivot. A pivot is something else. What is a pivot? A pivot is I found something interesting. Okay. So I found that some users are a very interesting niche of users. They're using this product a lot more or I found a new use case that is a lot more interesting than the previous one that I was serviced. I found something that is very interesting and promising, but I noticed that all the rest of my product and company and pricing or whatever it is, is added in another direction. And so I pivot. What pivoting means? Pivoting means that one thing stays still and the rest of it turns around it. This is pivoting. Okay. The same movement that...

[00:37:51 - 00:38:36]
I don't know what is the name of the tool that you use to draw circles. Okay, so one thing stays and the other revolves around it. This is a pivot. Okay. Um, you found something so interesting and so important that it's worth pivoting all the rest around it to make that one thing work. I'll make you a few examples. A feature, for example, you notice that a feature that you created that for you was one of the many features or a side feature, but you notice that a feature that you created that it can probably be the product and not just a feature. Okay. So for example, Instagram was not born as Instagram. It was born as Bourbon.

[00:38:36 - 00:39:26]
It was a check-in app. So an app to check yourself in places such as Foursquare or something like this. So you were in a place, you wanted to tell your friend, hey, I'm in that tower in the middle of San Francisco, you used Bourbon. Okay. Then they had a feature in which you could also upload a picture of where you were. And they discovered that the most active users were the ones using, attaching pictures to their check-ins. So they discovered that people were not interested just in saying their friends, I'm in this place. They were willing to show their friends pictures of the cool places they were. understood that this bragging about where you are, bragging about what you're eating, bragging about

[00:39:26 - 00:39:59]
blah, blah, blah, blah, all of this, this was the real thing. And so they revolved the whole product and they moved from a checking app to a picture sharing app, which was Instagram. And they eventually sold for 1 billion after a few years. Another pivot example, target. You notice that a certain target that you're serving is reacting to your value proposition a lot more than the rest of the users and the initial ICP that you were targeting or than your average user. And

00:40:00 - 00:50:00

[00:40:00 - 00:40:48]
so you decide that you want to reassess your whole product based on this. And so you decide that you want to zoom in on a specific type of user and use case because that's where the most interesting things are. Okay, they're enthusiastic about that. And so you decide, you change something. And sometimes it's something very different to what you have thought of. Like I was telling you before, from small shops selling souvenirs to e-commerce founders. very big pivot in terms of target. Okay. Sometimes it could also be a technology, for example, or an asset you're building. Okay. So there's some, you're, you're building a technology or an asset for yourself while servicing your, your customers. And you find out that this technology itself or this asset you're building is more interesting than your, than your product. An

[00:40:48 - 00:41:37]
example, the most famous example is Shopify. Shopify was a snowboard site. Okay. The founder of Shopify was passionate about snowboards. He was selling snowboards on an e-commerce site. The e-commerce site was beautiful. He created for himself, being a technical guy, he created for himself a CMS for managing the website. And so when he was talking with some other people having e-commerce at the e-commerce fairs and stuff like this, he was showing them, hey, look, I created this CMS for myself to manage my website. These people started saying, can you share the CMS with us? And we also use that CMS that you built yourself and so that was the moment in which he found out okay the snowboard website is nice but what is a lot more interesting for people is how I built the technology that I built this

[00:41:37 - 00:42:27]
snowboard website upon and this is how Shopify was created okay an example on how I iterated based on the scenario that I was describing before in my first startup. So 80%, double down on the core value. As I told, we found out that our core value was not helping them save money, it was helping them save time. And so we started thinking of additional ways to save them more time in booking shipments for each order they were receiving on Amazon, eBay, Shopify, wherever else. And we started working heavily on that. What kind of initiative would have you ideated or tried to help them save even more time to help these e-commerce founders save even more time while creating shipments?

[00:42:27 - 00:43:14]
Any idea? Could you please repeat the question? Yeah. So we discovered that our core value was time, saving them time. And so we started creating features and solutions to help them save even more time while going from, okay, receive an order from Amazon or eBay to I have created the shipping label and the carrier will come this afternoon. Okay. So we wanted to make this shorter. Our first thing that they were using was the CSV import. That was nice, but there were better ways to help them save even more time. Any idea? I don't know, I'm really this fast.

[00:43:17 - 00:44:08]
That's what we did. We started integrating the API of e-commerce platforms. So whenever they were receiving an order on Amazon, the Amazon order they received was automatically added to their dashboard on our product. As soon as they clicked create label, the shipment was created and we sent the API, the feedback to Amazon or Shopify or eBay. the shipping label was created, the shipment was created. So this was saving them a lot of time. No more copy pasting, no more exporting CSV, importing CSV, mark orders are shipped, something like this. Everything was done via API. And so this for them was like a 10x increase. Victor, go. So basically the key takeaway for us is if you really understand the key

[00:44:08 - 00:44:57]
pain point of your own icp which was in the situation time which you before maybe thought about but didn't really know then you can find even more double downing on how you can even save more time yeah correct and i think if this is really the core value this is the core thing that that you are judging you against okay that's that's how they're measuring you and your product So if you're a lot better than all the alternative and you get even better and better, that's one thing in which, okay, you become very good at something. Okay. Another part of it, again, should be about killing the value blockers.

[00:44:57 - 00:45:43]
Okay. So in our case, we discovered that they couldn't use us for shipments in which they already cheaper contract with carriers. Again, what would you do? What would they have done in our situation in order to remove this value

blocker? They loved our product. It saved them time, but for some shipments, it was too expensive because they had better rates with their own carriers. Sorry. yeah so basically you really needed to help them find a cheaper carrier basically for those shipments they had a they already had a cheap carrier but it was their own carrier so they were using their

[00:45:43 - 00:46:31]
carrier rates on the carrier website and we copy paste we had our carrier rates but they were too high for them and there was no way for us to get in to lower the price because it's based on the volume that you're shipping and so what we did is that we integrated the courier api to let them choose do you want to use our rate or the carrier rate in this way we passed from serving the 30 35 percent of their orders to 100 percent so they were using our platforms our platform for all of their orders okay sometimes they were shipping with our carrier sometimes they were shipping with their own carrier through their contract api okay of their carrier at that point it was pretty

[00:46:31 - 00:47:23]
clear that we needed to pivot okay it was pretty clear that our initial hypothesis we thought we were selling to small shops we thought that we were saving them money etc etc we found found another thing. Okay. So it was pretty clear that we didn't nail our initial hypothesis, but we found better ones. So it was worth it to revolve everything around. So what we did is that we pivoted from being a small shipping platform for small shop owners who want to offer shipments affordably to a shipping software for e-commerce vendors who want to ship their order faster. And for example, we switched from transaction-based. So before they were paying us the full price of the carrier of the shipment, we decided to switch from transaction

[00:47:23 - 00:48:13]
based to subscription based. So users were at a certain point, we discontinued our rates. We said, okay, we are not offering our own rates anymore. If you want to use our product, you have to have your own carrier rates. Okay. And so we were directly integrating them and this changed a lot. So the idea was that we were the hub between the e-commerce platform and the carrier. There's a question, I think. Oh, go, go, Christina. And good luck with the client. So we changed everything. Okay. We changed our definition of target. We changed our product went in a very different direction and we changed our pricing model, okay? From making money out of every shipment we were selling to, okay, you're using your own contract

[00:48:13 - 00:49:02]
rate. We are not reselling shipments anymore. We are selling a software as a service that allows you to manage your platforms and your carriers in a very quick way, okay? In the sheet that I share with you, you will find something if you want to do this same activity and to try use it again, use it as a guided brainstorming or something like this. Okay. But it could be useful for you. You can use AI as aspiring partner to prioritize backlog items to score them. But again, well prompted. So give them, give the LLM not just a list of future ideas, but also what is your core value statement and ask it to rank them by alignment to the core value statement

[00:49:02 - 00:49:49]
and also to the potential impact that it could have in increasing that value that you're creating. Okay, this first part was about understanding how to iterate on your product to make it a strong launchpad, okay, for growth. The next part of this session, which is the final part, will be about specific tactics and strategies that you can use to basically use your product as a way to acquire new users directly. Okay. How does it work? More or less. It's a loop, as you can see. every time you acquire a new user, these users perform an action and this action

[00:49:49 - 00:50:00]
creates outputs and assets that you can use to get new users on board. I work with examples to clarify. I'm illustrating three types of loops. The first type of

00:50:00 - 01:00:00

[00:50:00 - 00:50:48]
loop is the viral loop, okay? Viral loops happen when, work this way. Every time you acquire new users, some of these new users through the usage will share your product, willingly or not willingly, accidentally or intentionally, will share your product to new users and attract new users. Some examples. Value-based viral loop, okay? This happens when the product experience gets better when you invite other people from your network. Okay. Classic example as Slack, WhatsApp, social media, but also your product potentially could have some part or some features in which the product experience is better if shared with somebody else.

[00:50:48 - 00:51:36]
Okay. If there is somebody else on board that performs certain actions, it could be, I don't know, a provider, a client, a partner, whatever it is based on your product, of course. For some products, all of the things that I'm saying are not applicable to anyone. Okay. For some of them, for some products, it will be very relevant. For some others, not. The important thing is that you take out of this session the things that are very relevant for you. Okay. Another type of viral loop is the sharing-based loop. What is the difference? So the product itself or a feature is made to be shared. Okay. Classic example is type form. So you create a type form, but nobody creates a form for keeping the form for themselves.

[00:51:37 - 00:52:24]
Okay. You create a form because you want somebody else to fill it. So type form, use every form that is created as a way to advertise themselves. Okay. and to potentially acquire new users that create new form that acquire new users. Okay. So if your product or a feature that you're offering is made to be shared, so it's made to create something that somebody else could use and see, use it. Okay. Or also if there are some features that are in your pipeline and you might want to be developing them in a way that Okay, think of that because this could potentially give you opportunities to get new users on board just from their normal usage.

[00:52:24 - 00:53:13]
Okay, usage-based are the kind of viral loops in which users naturally showcase the product by using it. What is the difference between the sharing-based one and the usage-based one? So sharing means that the user actively shares the product. Okay, you copy the link to the type form and you send it to somebody else. means that it's not active it's not an active action it just happens for example shazam uh if you want to uh understand if you want to shazam a song to understand which the song is about you'll take your phone and and put shazam close to the source of the noise okay of the of the music uh everybody else who's around sees that you're doing something so right now it's pretty normal but when

[00:53:13 - 00:53:57]
Shazam was launched Shazam was recommending people to go very close to the speaker and so you everywhere in a bar or wherever you were you were seeing people going very close to the speaker with their mobile phone which means that everybody around was asking them what are you doing I'm Shazamming a song okay every time my song was Shazammed another 10 people or five people would notice and get aware of Shazam so the usage itself was a way for other people to learn about it or For example, there are some scanner apps like CamScanner that put a small watermark. This watermark is a way which every time you share a document scanned with CamScanners,

[00:53:58 - 00:54:45]
other people are aware that CamScanner exists and they are aware of something. Please go, Victor. I'm just very curious. Do you have specific Virolbs that you kind of prefer like the most that have? if we could use all of them which one would you kind of focus on it's kind of hypothetical question it's very hard to go into hypothetical questions of course because I would say it really depends on your product because it's like it really depends on your product dynamics and what you came up with but the thing is that most people when I say viral loop most people think okay the referral program now the referral program is just one type of viral loop that you can have be done in very different ways okay for some products it works great for some products it sucks

[00:54:46 - 00:55:51]
and so if you're asking what's my favorite out of this list i would say the usage based but it's not just my personal favorite but it's not like because it's very spontaneous and it's very tied to the product value but not for all the product this is applicable of course last but not least the The incentive base, which is what you're probably most used of, something like referral, campaigns and stuff like this, in which users are incentivized to share the product. Okay. You

give them an incentive. Important. When you can give them an incentive, which is tied to the value that you're giving, this works wonder usually because people don't get bored. The best example of this is Candy Crush. Candy Crush became great through the mechanism with which every time you were running out of lives on Candy Crush, you could ask your Facebook friends to gift you a free live on Candy Crush, which meant that every time you click the button, okay, ask your friends for lives, all your friends were receiving a notification.

[00:55:52 - 00:56:38]
Hey, Jaquem is asking you for a free live on Candy Crush. Check it out. And when people were clicking on that notification, they discovered Candy Crush. And so this was basically free advertising for them. And the incentive that they were offering you was an additional life on the game. So it was tied to the usage of the product itself. But in general, there are a lot of referral campaigns. Thing is that referral campaigns, we are overwhelmed with the referral campaigns. You receive an email every day. If you invite a friend, your bank does it, your insurance does it, everybody does it. So it became very boring and very unsuccessful. The success rates of referral campaigns is getting lower and lower every day. Why? Because people get used to this kind of things.

[00:56:38 - 00:57:24]
So you want to find ways to escape the boring part of the referral campaign. So it's not the first time you received an email saying, hey, you will receive $60 if your friend starts using this product. You were like, wow. Now you're like, hmm, another referral campaign. to my friends and stuff like this. So you want to make sure that you are incentivizing them the right way. And the best incentives are tied to the usage for both parties. Okay. So we're giving you additional usage and you're gifting another person with extra usage, which means that they're attracting the people that are probably interested to that. But also if you run a good old referral campaign with the classic incentive in money, make sure that you make it in a non-boring way.

[00:57:24 - 00:58:09]
And this is an example. This is Airbnb playing with the loss aversion factor. Okay. It's not just, hey, take $25 credits for every friend you invite. It's, hey man, you just lost $25 because your friend was in your address book joined on themselves. So this worked really well because people get used and bored by marketing tactics. So $25 for credit for inviting people, that's boring. I just lost $25. Let me think if I can invite people not to lose $25 anymore. Okay. So there are many ways to do this. An additional type of loop on top of the viral loop is the content loops. So how does it work?

[00:58:11 - 00:58:58]
Every time you acquire a new user, with their product usage, they don't share the product itself directly. Okay. But they share or create content that attracts new user. That's very similar, but it's not about the specific capabilities of the product or the specific features of the product. It's about something that you are creating with the product. I'll give you some examples. User generated content for SEO. Okay. So this is very good whenever you have some part of your product in which users can create content with your product that get indexed by search engines and by consequence by AI elements.

[00:58:59 - 00:59:44]
And this attracts new users. For example, there are a lot of companies that have a public community. And this public community, the questions and replies that people ask in the community ranks organically on Google and LLMs. And this is a source of new traffic. And this comes directly from their usage of the product. Okay. But even more, Reddit, Quora. Okay. Every time a person writes something on Reddit, the something that they write attracts new users. Because if you look for something and you end up on Google or ChatGPT and you end up on Reddit, you might be start thinking, okay, let's use this Reddit.

[00:59:45 - 00:59:59]
There is a variant of the user-generated content, which is sharing-based, okay? That's very similar. but in this case the product doesn't they don't just create content that

01:00:00 - 01:10:00

[01:00:00 - 01:00:47]
sits there and gets indexed they create content to share it for example notion notion gets an insane number of new users from people that create templates on notions and they share them okay so if you have some kind of preset template or whatever it is that people could potentially sorry i have as i told you before So if there is some kind of content that people could create to your website and could share, but instead of sharing a screenshot, anonymous screenshot, you help them sharing it with a link or whatever it is, that's very good for you. And it could result potentially in you getting new users.

[01:00:48 - 01:01:33]
Okay. Another example is what I call the company generated content, which is when through the usage, your users generate some very interesting data for you that you could turn into content. Okay. So you have a very specific insight and point of view that is based on what you observe being inside this company. Okay. Trends and things that you see that people are starting to do in the different, et cetera, that could result in content that attracts new people. The best example for this is Carta. Carta is a platform to manage your equity, your cap table.

[01:01:35 - 01:02:22]
So every time a company that is using Carta receives a round of financing, even if the round is undisclosed and the conversions are undisclosed, etc., etc., Carta knows how many people entered into the cap table for what percentage, etc. Of course, they are not releasing this as a public information because this is a private software. But every couple of weeks, they release some reports. Something like, okay, state of fintech funding in early 2026, for example. Okay. So they pull together this data, anonymize it, of course. For example, when you see those charts showing you that, for example, I don't know, the seed

[01:02:22 - 01:03:09]
rounds went down 50% this year in terms of total amount or something like this, this probably comes from Carta, okay? Because they gather this information, etc. Nice percentage of the people who look this kind of content and this kind of report could potentially be Carta's clients, okay? And so this heads them towards the product. Last but not least, there is the user plus company generated content, which works like this. So sometimes users ask questions or ask for features or ask for integrations that the company can leverage to create content. For example, Zapier has a lot of pages promoting integrations that they still haven't published. And the reason is that this is a way for them to attract new users and to prioritize the

[01:03:09 - 01:03:59]
next integrations to be built, which is a very clever way of working this way. How do they know which integrations to start putting into the... I mean, they have to start creating landing pages for that integrations. People ask for that. They don't just... Based on the request, they don't just develop it, but they put them into their queue and then they prioritize it based on the request that they get from that specific landing page. Sorry again. So AI, as you know, lowers the barrier to content creation dramatically. Some examples. You can take all your support chat and you can turn the most frequently asked question into articles that you can use for both assistance and for getting new leads because some of these people will ask.

[01:04:00 - 01:04:47]
So when you release your help desk publicly, you have no idea how many keywords it will rank for and how many new people it will attract. You can give your users in an easy way tools to polish what they did or share it. So make things that they did with your product shareables. Just a simple share the screen with a link or something like this. That's very simple. So we pass from sharing screenshots of ChatGPT to sharing links to the chat when other people could see the full chat. That's an example of making something that is not thought for sharing. It's not for private conversation, not for sharing, but they built a sharing feature because with this one, you can say, you can send to your friend,

[01:04:47 - 01:05:33]
hey, look at this conversation I had with ChatGPT without having to send screenshots. And this takes them into the product, okay? You can use AI also to leverage the data that you have internally into something potentially publishable and interesting. Same thing as Carta does with the state of fintech report, state of funding report, state of seed funding report, et cetera, et cetera. that a lot of people are reading because they have some data internally that they can leverage to make them into content. Last loop I'll show you is the paid loop. How does it work? It works when

for all your users or for a specific subset of your users or your clients, you can find a specific subset of your client

[01:05:33 - 01:06:21]
in which the revenue that they generate immediately or almost immediately the costs that you incurred into acquiring them. And so you can afford yourself to, for that specific target or for all your ICP, I have no idea, you can afford yourself to get them into a loop in which every time you acquire a new user, you reinvest the money that they give you to acquire a new one. Okay, again and again and again. So my suggestion is always to build, of course, a second loop because paid loops can get tricky, which means that Google Ads can switch your ads off tomorrow for any new kind of policy. So you want to make sure that this is not your only loop.

[01:06:22 - 01:07:10]
I'll show you some examples. For example, Booking.com strongly relies on paid loops. Why? they take 20% out of every booking. So in the moment in which you look for something on Google, you click on the ad and you book on it, you immediately give them the money back. So the payback period is very short. They recover the cost for acquiring you in a very short timeframe. And so they can keep reinvesting again and again in ads. Sometimes it is with search engines. Sometimes it is with display, like display banners or social media. Dollar Shave Club who were able to get the first payment for getting subscribed to the

[01:07:10 - 01:07:58]
Dollar Shave Club so quickly through Facebook ads that they basically were doing this again and again and again. So again, this works very well for channel or niches of your target in which the payback period period is very quick. Okay. Okay. Or an example could be affiliate channel. Channel is like distribution partnerships or something like this. There are some scenarios in which you can have a distributor that or a sales, external sales that gets your customers at a fraction of what they cost you. And so if you're in that scenario, just increase the volume and try to get more and more of this because you know that the moment in which they pay you, you have to pay a portion back, but this is more than profitable and you can use it as a loop so that every time new money enter,

[01:07:58 - 01:08:47]
you have budget for the next one. Okay. An example of how to design a growth loop. So first of all, place yourself in front of the different type of loops and think, okay, is my product a good candidate for that specific loop or can it be in a short time? If the reply is no, let it go for the moment. If it's yes, highlight it. So in the case of Shippee Pro, the experience was not better with the network on board. Okay. No e-commerce company wanted the other e-commerce people or vendors or partners on board. They didn't need it. Okay. There were no features made to be shared, but there was a point in the customer journey, which uses main network is the product,

[01:08:47 - 01:09:39]
which is the tracking emails. We were not sending out tracking emails, but we started to, because this was a moment in which all the clients of our clients would become aware of Shippee Pro. Most of them didn't have an e-commerce company, will never have an e-commerce company, so they were not interested. But a small portion of them eventually clicked on the link at the end of the website to understand about our product, and some of them subscribed. And this was basically free We were sending these tracking emails anyway. And so we started engineered them in a way which, okay, do you own an e-commerce? Click here to learn more about Chippy Pro or something like this. Another thing that we discovered is that we were receiving a lot of user requests for new integration.

[01:09:39 - 01:09:59]
Okay. People were asking like, when are you adding this new carrier? When are you adding this new sales platform? Blah, blah, blah. Whenever we started receiving new integration requests, we were creating a landing page. This landing page would organically rank. As soon as we were getting enough requests for that specific

01:10:00 - 01:20:00

[01:10:00 - 01:10:49]
integration, not only we already have the waiting list for that specific integration in place, but we were able to prioritize it, launch it, and communicate to the right people, hey, this integration is ready, join ShipRePRO now. And so this works very well, and this helped us generate new users through content creation, which was these landing pages promoting integrations that we were developing, okay, based on the questions and requests that we were asking. Last but not least, our payback period was not short, it was more than one year on average, but we found that a specific client type in which it was shorter, which were very small carriers that wanted to offer a white

[01:10:49 - 01:11:39]
label software to their clients. Okay, so they were very small clients, very small carriers, so they didn't have a website in place with e-commerce integration. And they were like, okay, I want to offer my clients e-commerce integrations. Can you make a white label for us? And so for them, the payback period was immediate because we were having them pay immediately as soon as the white label was released. And so this was a specific type of users in which it was affordable for us to just keep going with the paid model because every time they were getting in, they were immediately giving us back the money to reinvest and there was no cash flow issue or something like this. I told you everything. I did a name and there was a second part. This is what I told you

[01:11:39 - 01:12:28]
right now. So if you want, you can do the same thing. Again, start with the areas in which you have more potential, okay, which put yourself in front of this question and say, is there something in which I have already something that could be potentially a good base or I could create something that could be potentially a good base and use it as a brainstorming and try to identify the ones with the highest potential, something important. First, again, this session was two parts. First part was creating a very strong usage and strong core for your product. Second part was turning this usage into something that attracts new users. Okay. You want to fix the first one first. Okay. First, you get to a situation in which you have enough users running,

[01:12:29 - 01:13:15]
usage your product, using your product, sorry. And then you think, okay, how do I turn this usage into something attractive for new people? But it goes in that order. So for some of you, it might be a little premature to think of growth loops right now. If it is, postpone it. Just remember about it. But if you're already in the situation in which you have enough users to justify, hey, maybe the usage that they're doing can bring in new users. Okay. That's potentially something in which you can think of something and ideate something. Okay. I don't know if there are questions. I mean, for me, I really liked the viral loops ideas, the concepts. It was like really good to see the segmentation.

[01:13:16 - 01:14:01]
So I already tried to play with chat GPT to like see some ideas of where we can implement the viral loops. So I don't have maybe specific questions. I just want to say for me, that's been the most kind of eye-opening for this session for sure. good inspiration of thinking how we can leverage our users that we have already to drive even more usage out of them by sharing or doing like some type of family package where we package all of their family to do the health check-in so like kind of just I have a lot of ideations right now from that segment so that's been very helpful for me. Thank you I have a question for you which is what's one action you want to take next I ask you to reply and to

[01:14:02 - 01:14:52]
say something, the name of somebody that you betray, which means somebody that you want to listen from and to reply this question to. So, Victor, you have the honor to go first. What's one action you think you want to take next? Me specifically from this conversation? I'm very focused right now on what we have to do. like we have a certain focus especially for this week so I don't think I want to delay my focus right now but I think at least put the I will put the viral loops into my kind of plan to think about where we can actually run those viral loops I think that's been very helpful so I don't know if I will take the action today because that will delay my focus but

[01:14:52 - 01:15:41]
at least put it on to like a to-do list for sure because then I can see a ton of potential in our business specifically, how we can duplicate that shareability through our platform and through the users that we already have. And we'll have a lot more very shortly as well. Thank you. Who do you want to hear from? Who are you betraying? I will, I mean, I think Yulia was here also watching everything. So maybe I'll go to Yulia next. Well, yeah, I share i share the same observation as victor about viral loops it's more difficult for b2b businesses definitely the part of referral perhaps we

will discuss it with you uh giacomo will be

[01:15:41 - 01:16:28]
very interested to see how we can um activate this part perhaps in webinars or making uh i don't know some kind of pr with brand ambassadors that we can potentially hire um yeah i have few But yeah, definitely referrals and how we activate them will be our next step. Thank you. Who do you want to hear from? Last one? Dmitry. I see him. Sorry, Dmitry, you are on my Zoom. Yeah, okay. No worries. She owes you something. First of all, I think... She owes you a dinner. Sorry? She owes you a dinner now for calling your name.

[01:16:29 - 01:17:15]
Yeah. So first of all, I think that we have some issues in clarification, our core value, because for different segments, we, they see different values. yeah and so it is a challenge for us and we will book a call with you and maybe a brainstorm around it yeah thank you okay make sure that you bring your all your questions in the office hour I'm ready for you and important again I repeat it because sometimes

[01:17:16 - 01:18:05]
important to repeat things so bring the most important things on your table if they are related to what we have covered today that's okay if they are not related to what we have covered today that's okay okay we have 45 minutes together make the best usage of this time so coming with an agenda and structured questions that's the best way to make the most of the 45 minutes that we have together so i advise you to do so and then if you want to discuss something we heard important that's great otherwise whatever else just let's make the best usage of the time that we have together okay the sparring startup starts your your company as well or what's the connection there uh that's my like that's like my personal brand yeah okay okay so what to know

[01:18:08 - 01:18:54]
okay i don't know if there is any question left otherwise i can say goodbye i would have personal Eric has one I think sorry I did not raise my hands but grazie Giacomo thank you you're welcome okay Victor you had a question yeah I mean I'm curious it's your experience like more on that kind of creative side like consumer B2C as well like what would you say like where do you like to position yourself if you were to like position yourself core kind of gift? Half of my career I've been in B2B, half of my career I've been in B2C. Okay, good. First product was B2B, second product

[01:18:54 - 01:19:39]
was B2C, third product started as a B2C and then we went into B2B. Okay, so you've seen both worlds from all angles and product focus is your thing, right? You said you are a fractional CPO, it's like product, anything product related you love basically. Yeah, I do. very beginning with the first product that is the one that I was telling you about at the very beginning we were three it was a bootstrapped product which means that for one year and a half we had some rules but we had whatever has had to be done and so I was in charge of product marketing and design I had no idea what design was about and how to use Figma or something like this which means that the product that you can use it right now if you go to shippepro.com

[01:19:40 - 01:19:59]
it's the one that I designed with a Microsoft paint and I'm very proud of that like the timing which we need to do you know at the beginning it's like of course there are rules the stuff but we have to do what we have to do so if we are in trouble with the commercial side even the cto jumps in and helps with i don't know technical

01:20:00 - 01:20:36

[01:20:00 - 01:20:32]
marketing, technical steps, setups and stuff like this. Because it's like we're all on the same boat at the end of the day. So, yeah. Yeah. Thank you. It's been a very valuable session for me as well. So thanks so much for taking your time. Thank you. Thank you. Okay. I'm waiting for you in office hours. You have the link to book. And so I'm waiting for your booking to come in and see you in the next of this week. Friday. Thank you guys. Thank you everyone for joining. Thank you, Giacomo. Thank you.
